INSTRUCTION MANUAL
FOR
OVERCURRENT RELAYS
BE1-50/51B-214/-215/-223/-225

Basler Electric

Publication: 9252000994
Revision: N 04/10
INTRODUCTION

This instruction manual provides information about the operation and installation of the BE1-50/51B-214/-215/-223/-225 Overcurrent Relays. To accomplish this, the following information is provided:

- General Information and Specifications
- Controls and Indicators
- Functional Description
- Installation and Maintenance
- Testing

WARNING!
To avoid personal injury or equipment damage, only qualified personnel should perform the procedures in this manual.
It is not the intention of this manual to cover all details and variations in equipment, nor does this manual provide data for every possible contingency regarding installation or operation. The availability and design of all features and options are subject to modification without notice. Should further information be required, contact Basler Electric.
### REVISION HISTORY

The following information provides a historical summary of the changes made to this instruction manual (9252000994). Revisions are listed in reverse chronological order.

<table>
<thead>
<tr>
<th>Manual Revision and Date</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>N, 04/10</td>
<td>• Added BE1-50/51B-223 model.</td>
</tr>
<tr>
<td>M, 07/09</td>
<td>• Added the required information to document part number 9252000215.</td>
</tr>
</tbody>
</table>
| L, 01/09                | • Removed notes about hard-wiring relay case to ground since relay is a direct replacement, i.e. not shipped with a case.  
                          • Updated Storage statement in Section 4.  
                          • Modified Figure 5-2, Target Operational Test Setup.  
                          • In Section 5, modified Target Test so that TIME and INST targets can be verified independently from each other.  
                          • Minor text edits throughout manual. |
| K, 03/08                | • Updated front panel drawings to show new reset button and targets. |
| J, 01/07                | • Moved Time Characteristic Curve Figures to Appendix A.  
                          • Moved Section 6, Maintenance information into Section 4, Installation. |
| H, 05/06                | • In Section 5, Testing, Test Procedure, Models BE1-50/51B-225 (One Ampere Sensing Input) Time Dial Test, corrected the elapsed time stated in step 2.  
                          • Added the relay’s metric weight to Section 1, General Information, Specifications.  
                          • Moved contents of Section 7, Manual Change Information to the manual introduction and deleted Section 7. |
| G, 03/00                | • Added the required information to document part number 9252000225. |
| F, 12/00                | • Updated the drawings in Section 2 to reflect PC board updates.  
                          • Updated the remainder of the manual to reflect switch designation change from SW8 to SW3.  
                          • Added new functional description to the Active/Pickup LED (formerly designated Pickup LED). |
| E, 12/99                | • Changed all target test current references to 1 Aac.  
                          • Deleted step 5 of Section 6, Maintenance, Periodic Tests. |
| D, 05/98                | • Added the patent number to Section 1, General Information, Specifications.  
                          • Updated format of the manual. |
| C, 12/95                | • Added material to document the addition of five characteristic curves and ability to select curve groups GE IAC or ABB.  
                          • Changed Section 5, Testing to use the GE IAC curve group. |
| B, 10/95                | • Changed Figure 5-2 and all references to the target testing current source from 0.2 to 1.0 amperes.  
                          • Corrected various, minor typographical errors in Sections 1 and 2. |
| A, 08/95                | • Removed all references to switch SW8-4 being field settable. |
| —, 07/95                | • Initial release |

SECTION 1 • GENERAL INFORMATION

INTRODUCTION
BE1-50/51B-214/-215/-223/-225 protective relays are direct replacements for General Electric, IAC relays. The BE1-50/51B-214/-215/-223 has a 5 ampere current sensing input. The BE1-50/51B-225 has a 1 ampere current sensing input. Compatible IAC model numbers are listed in Table 1-1.

* Any digit covering all pickup ranges and 50 Hz or 60 Hz models.

To replace an existing IAC relay, perform the following steps.
1. Select the desired relay settings on your new BE1-50/51B-214/-215/-223/-225 relay.
2. Remove the existing IAC relay.
3. Attach the cover adapter to the existing case.
4. Insert the new relay.
5. Reinstall the existing connection plug.
6. Install the new Basler Electric cover.

Basler Electric BE1-50/51B-214/-215/-223/-225 protective relays are self-powered, microprocessor-based, non-directional phase or ground relays that monitor the magnitude of a single-phase ac current to provide accurate instantaneous and time overcurrent protection for 50 Hz or 60 Hz power systems. Each model covers 10 popular time characteristics and a wide range of pickup settings.

FEATURES
A wide range of pickup settings and front panel selectable time characteristics permit applications involving coordination with fuses, reclosers, cold load pickup, motor starting, and fixed time requirements. Also, an integrating reset function is available to simulate the disk reset of electromechanical relays.

BE1-50/51B-214/-215/-223/-225 overcurrent relays have the following standard features.
- Independent time and instantaneous elements
- A secure method to manually trip the breaker at the relay front panel
- Direct reading front panel controls
- Minimum pickup setting for safety during installation
- Time characteristics extend to a pickup multiple of 40
- Rugged draw-out construction with steel case
- Gravity latching targets retain indication without power
- Built-in accuracy eliminates internal adjustments
- Minimum transient overreach
- Field selectable characteristic curve selection similar to either GE IAC or ABB type curves
- Field selectable instantaneous or integrating reset
- Field selectable 50 or 60 Hz operation
- Field selectable 0.0 or 0.1 second, fixed, instantaneous delay
Internal switches provide for selecting system operating frequencies of 50 or 60 Hz, instantaneous element delays of 0.0 or 0.1 second, characteristic curve group selection for either GE IAC or ABB type curves, and instantaneous or integrating reset characteristics. Switch location and description is provided in Section 2.

**Advantages**
BE1-50/51B-214/-215/-223/-225 overcurrent relays have many advantages over other overcurrent relays. The primary advantages are:

- Time characteristics are defined by equations and graphs
- Field selectable time characteristics
- Very low burden extends the linear range of the CTs
- Self powered from the sensed current
- Continuous automatic calibration

BE1-50/51B-214/-215/-223/-225 overcurrent relays may be tested without removing the relay from the case. Shorting contacts are provided for all current inputs when the connection plugs or relay chassis is removed from the relay case.

**SPECIFICATIONS**
BE1-50/51B-214/-215/-223/-225 overcurrent relays have the following features and capabilities.

**Current Sensing Input**

**BE1-50/51B-214/-215/-223**
- Continuous Current: 14 Aac
- One Second Rating: 400 Aac

**BE1-50/51B-225**
- Continuous Current: 2.8 Aac
- One Second Rating: 80 Aac

**Time Overcurrent (51) Element**
Setting the TIME PICKUP control at the minimum pickup setting places the relay in the most sensitive state and may be used as a safety setting.

**BE1-50/51B-214/-215/-223 Pickup**
- Setting Range: 0.5 to 15.9 Aac
- Setting Increment: 0.1 Aac
- Accuracy: ±2%, ±25 milliamperes at or above 0.5 ampere setting

**BE1-50/51B-225 Pickup**
- Setting Range: 0.1 to 3.18 Aac
- Setting Increment: 0.02 Aac
- Accuracy: ±2%, ±5 milliamperes at or above 0.1 ampere setting

**Dropout**
Dropout occurs at 95% of pickup value.

**Timing Range**
0.0 to 9.9 seconds in 0.1 second steps.

**Timing Accuracy**
The timing accuracy is the sum of ±1 cycle, ±2%. This accuracy applies to the range of 1.3 to 40 times tap and is for a given measured multiple of tap. The measurement of the multiple of tap has an accuracy that is the sum of ±2%, ±25 milliamperes for the BE1-50/51B-214/-215/-223 and ±2%, ±5 milliamperes for the BE1-50/51B-225.
**Timing Accuracy Example (BE1-50/51B-214/-215/-223/-225)**

PU setting: 5 amperes
Current Applied: 6.5 amperes
+ Multiple Tolerance: 6.655 amperes
– Multiple Tolerance: 6.345 amperes
Time Curve: E
Time Dial: 5.0
Minimum time dial using 6.655 amperes: 46.5470 seconds
Maximum time dial using 61.3968 amperes: 61.3968 seconds
Curve time using 6.5 amperes: 53.1800 seconds

**Curve Characteristics**

Nine inverse time functions and one fixed time function can be selected by the front-panel Curve switch. Characteristic curves for the inverse and definite time functions are defined by the following equation.

\[
T_T = \frac{AD}{M^N - C} + BD + K
\]

Where:
- \(T_T\) = time to trip in seconds
- \(D\) = time dial setting
- \(M\) = multiple of pickup setting
- \(A, B, C, N, K\) = constants for the particular curve

Time characteristic curve constants are listed in Tables 1-2 and 1-3. Constants have been selected to conform to the characteristics of electromechanical relays over a range of pickup multiples from 1.3 to 40. Values of the constants are provided for use in computer relay setting software. Timing accuracy is ±1 cycle, ±2 percent of time to trip.

### Notes for Tables 1-2 and 1-3

* BE1 Curve Types:
  - S: Short Inverse
  - L: Long Inverse
  - D: Definite Time
  - M: Moderately Inverse
  - I: Inverse
  - F: Fixed Time Delay
  - V: Very Inverse
  - E: Extremely Inverse
  - B: BS142 Very Inverse
  - C: BS142 Extremely Inverse

† Figure numbers refer to the characteristic curves located in Appendix A, *Time Characteristic Curves.*

‡ Curves B and C are defined in British Standard BS142 and IEC Standard IEC 255-4.

§ Fixed time delay, adjustable from 0.1 to 9.9 seconds.

### Integrating Reset

Reset begins when the current drops below 95% of pickup. Integrating reset simulates the disk reset of electromechanical relays. BE1-50/51B-214/-215/-223/-225 relays provide the integrating reset function even when input current falls to zero.

Integrating reset characteristics are defined by the following equation and shown in Figure 1-1. Equation constants are provided in Tables 1-2 or 1-3.

**Integrating Reset Equation:**

\[
T_R = \frac{RD}{M^2 - 1}
\]

Where:

- \( T_R \) = Time to reset in seconds
- \( R \) = Constant for the particular curve
- \( D \) = TIME DIAL setting
- \( M \) = Current in multiples of PICKUP setting during reset

---

**References:**

Setting the INST PICKUP control to the minimum pickup setting places the relay in the most sensitive state and may be used as a safety setting.

**BE1-50/51B-214/-215/-223 Pickup**
- Setting Range: 1 to 99 Aac
- Setting Increment: 1 Aac
- Accuracy: ±2%, ±25 milliamperes at or above 1.0 ampere setting

**BE1-50/51B-225 Pickup**
- Setting Range: 0.2 to 19.8 Aac
- Setting Increment: 0.2 Aac
- Accuracy: ±2%, ±2 milliamperes at or above 0.2 ampere setting

**Dropout**
Dropout occurs at 95% of pickup value.

**Curve Characteristics**
Instantaneous characteristic curves are similar to standard electromechanical instantaneous units. However, the time to trip for applications where the initial current through the relay is less than 0.4 ampere (5 ampere relay) or 0.08 ampere (1 ampere relay) may be slightly longer. This may occur on a very lightly loaded circuit or when the relay is providing ground protection and is connected to measure neutral current. Figure 1-2 shows the instantaneous characteristic curves for maximum time to trip.

An additional fixed delay of 0.1 second may be added with internal switch SW3-2. This delay applies to both phase and ground applications. Closing switch SW3-2 provides an additional delay of 0.1 second. Section 2 illustrates the location of SW3.

The instantaneous element in BE1-50/51B-214/-215/-223/-225 relays may be set lower than the instantaneous element in IAC relays and still have the same reach. This is because the BE1-50/51B-214/-215/-223/-225 instantaneous element effectively eliminates the fault current transient overreach components. When calculating BE1-50/51B-214/-215/-223/-225 relay instantaneous element settings, calculate the symmetrical value without any adder for transient overreach.
**Burden**

Burden is non-linear. Figure 1-3 illustrates the device burden.

**BE1-50/51B-214/-215/-223**
- At 0.5 amperes: 4.8 Ω
- At 5.0 amperes: 0.2 Ω

**BE1-50/51B-225**
- At 0.1 ampere: 120 Ω
- At 1.0 ampere: 5 Ω
Frequency Response
A change of ±5 Hz from the nominal 50/60 Hz current causes <0.5% change in the current required for pickup.

Transient Response
<10% overreach with system time constants up to 40 ms.

Harmonic Response
Figure 1-4 shows that a relay set for 1 ampere pickup would pick up at 0.96 amperes with a current containing 40% seventh harmonic. This corresponds to a 10:1 rejection ratio. Other conditions may be evaluated in the same manner.
Target Indicators
Gravity latched, manually reset targets indicate that current of 0.2 amperes or greater was present in the trip circuit. Target coil resistance is less than 0.1 ohms and operate time is less than one millisecond. See Output Contacts for maximum current rating.

Output Contacts
Output contacts are surge protected and rated as follows.

Resistive Ratings
120/240 Vac: Make 30 amperes for 0.2 seconds, carry 7 amperes for 2 minutes, 3 amperes continuously, and break 5 amperes.
125/250 Vdc: Make 30 amperes for 0.2 seconds, carry 7 amperes for 2 minutes, 3 amperes continuously, and break 0.3 ampere.

Inductive Ratings
120/240 Vac, 125/250 Vdc: Make and carry 30 amperes for 0.2 seconds, carry 7 amperes for 2 minutes, 3 amperes continuously, and break 0.3 ampere. (L/R = 0.04).

Type Tests
Isolation
Meets IEC 255-5 and exceeds IEEE C37.90-1989, one-minute dielectric (high potential) tests as follows.
All circuits to ground: 2,828 Vdc or 2,000 Vac
Input to Output Circuits: 2,828 Vdc or 2,000 Vac
Surge Withstand Capability

Impulse
Qualified to IEC 255-5.

Radio Frequency Interference (RFI)
Field-tested using a 5-watt, hand-held transceiver operating at random frequencies centered around 144 MHz and 440 MHz, with the antenna located 6 inches from the relay in both horizontal and vertical planes.

Vibration
Withstands 2 G in each of three mutually perpendicular planes swept over the range of 10 to 500 Hz for a total of 6 sweeps, 15 minutes each sweep.

Shock
Withstands 15 G in each of three mutually perpendicular planes.

Environment
Operating Temperature: –40°C to 70°C (–40°F to 158°F)
Storage Temperature: –50°C to 70°C (–58°F to 158°F)

Agency Recognition
GOST-R Certification
GOST-R certified per the relevant standards of Gosstandart of Russia.

Physical
Weight: 6.1 lb (2.77 kg)

SECTION 3 • FUNCTIONAL DESCRIPTION

GENERAL
BE1-50/51B-214/-215/-223/-225 Overcurrent Relays are microprocessor based non-directional relays that measure ac current to provide secure and reliable instantaneous and time overcurrent protection for power systems.

FUNCTIONAL DESCRIPTION

Sensing Input
Single phase ac current from system current transformers (CT) is brought into the Overcurrent Relay at terminals 5 and 6. Refer to Figure 3-1 to follow the functional description for the BE1-214/-225. Refer to Figure 3-2 to follow the functional description for the BE1-50/51B-215. Refer to Figure 3-3 to follow the functional description for the BE1-50/51B-223. The input current is applied to internal power and signal CTs.

Power Supply
Current from the power CT is rectified, filtered, and supplied to all relay internal circuitry for operating power. A precision +5 Vdc supply also serves as a reference for automatic calibration.

Instantaneous Signal
Current from the signal CT is rectified and applied to the instantaneous scaling resistors controlled by the INST PICKUP selector switches. The analog voltage of the instantaneous input signal developed across the scaling resistors is filtered and applied to the multiplexor (MUX).

Time Signal
Current from the signal CT is also rectified and applied to the time scaling resistors controlled by the TIME PICKUP selector switches. The analog voltage of the time input signal is also filtered and applied to the multiplexor.

Microprocessor
Operating power from the power supply is applied to the microprocessor supervisor circuit. When the microprocessor is active and executing code, the ACTIVE/PICKUP LED is green. When the input current falls below an acceptable level, the supervisor circuit interrupts the microprocessor, halts further operation, and turns OFF the ACTIVE/PICKUP LED. A microprocessor watchdog feature resets the microprocessor program when the program flow is interrupted.

Information from the TIME DIAL selector switches, the TIME CURVE selector switch, and the 50/60 Hz, INST DELAY, and RESET CHAR switches is also applied to the microprocessor. The microprocessor uses these inputs to set the operating parameters.

When the microprocessor is ready for analog information from the multiplexor, microprocessor control signals cause the multiplexor to route the desired input through to the output. The output is converted from an analog value to a digital value and applied to the microprocessor.

The microprocessor performs the program operations based on the inputs and the internal software program. When the sensed current exceeds the TIME PICKUP setting, the ACTIVE/PICKUP LED turns from green to red. TIME contacts (51) are closed in accordance with the time characteristic equation. If the sensed current exceeds the INST PICKUP setting, the INST contacts (50) are closed.

Power-Off Sensing
Power-off sensing circuits measure the voltage across a capacitor at power-down and at power-up. These circuits determine how long power has been removed based on the difference voltage and the circuit RC time constant. This provides information for the integrating reset function even when power has been entirely removed.
Outputs

**Instantaneous and Timed**

System circuit breakers controlled by the output contacts can be manually tripped by applying a short across the TIME or INST MANUAL TRIP front panel test points. Current flow in the trip circuit is indicated by the operation of the target. The targets will not operate without adequate operating power for the relay.

---

**WARNING!**

Trip circuit voltage is present at the front panel test points. When shorting the test points, use insulated jumpers to avoid contact with these voltages.

SECTION 4 • INSTALLATION

GENERAL
When not shipped as part of a control or switchgear panel, the relays are shipped in sturdy cartons to prevent damage during transit. Immediately upon receipt of a relay, check the model and part number against the requisition and packing list to see that they agree. Visually inspect the relay for damage that may have occurred during shipment. If there is evidence of damage, immediately file a claim with the carrier and notify the Regional Sales Office, or contact the Sales Representative at Basler Electric, Highland, Illinois.

Proper operation of the relay may be confirmed by performing the operational test procedure of Section 5. If the relay won't be installed immediately, store the relay in its original shipping carton in a moisture and dust-free environment.

FACTORY SETTINGS
Factory settings for the internal switches of SW3 are as follows:
- SW3-1 — OFF (60 hertz operation).
- SW3-2 — OFF (0.0 additional fixed delay for the instantaneous element).
- SW3-3 — ON (GE IAC type characteristic curves).
- SW3-4 — ON (Integrating reset characteristics).

INSTALLATION
Select the desired relay settings before putting the relay into service. Changing pickup current settings while the relay is in service may cause tripping. Perform the following procedures to install the BE1-50/51B-214/-215/-223/-225 relay.
- Select the desired relay settings on your new BE1-50/51B-214/-215/-223/-225 relay.
- Remove the existing IAC relay.
- Use the four screws provided and attach the cover adapter to the existing case.
- Insert the new relay and close the cradle latches locking the relay into the case.
- Reinstall the existing connection plug.
- To install the cover, position the interlocking bracket at the top of the new Basler Electric cover into the mating receptacle at the top of the cover adapter plate. Secure the captive fastener at the bottom of the cover.

APPLICATION COORDINATION
In a typical application coordination scheme, a BE1-50/51B-214/-215/-223/-225 is being used to provide primary protection for a radial distribution feeder. An electromechanical overcurrent relay with extremely inverse timing provides protection for the transformer and bus. To improve coordination with the electromechanical relay, the BE1 relay with integrating reset characteristic has the time characteristic curve E (extremely inverse) selected (SW3-3 set to OFF) and the TIME DIAL set to 2.0. The feeder reclosing relay is set for two reclose attempts at 3 and 15 seconds after the initial trip. If a permanent fault occurs (magnitude ten times pickup), calculate the feeder breaker trip time for each of the three operations. Refer to Section 1 for characteristic curve constants.

From the time characteristic curve equation.

$$T_{Trip} = \frac{AD}{M^N - C} + BD + K$$

$$= \frac{7.7624 \times 2}{10.20938 - 1} + (0.02758 \times 2) + 0.028$$

$$= \frac{15.5248}{124.10806 - 1} + 0.05516 + 0.028$$

$$= 0.209 \text{ seconds}$$
From the reset characteristic curve equation.

\[ T_{\text{Reset}} = \frac{R_D}{M^2 - 1} \]

\[ = \frac{7.75 \times 2}{0^2 - 1} = -15.5 \text{ seconds} \]

M = 0 if current goes to zero.
Negative result indicates reset time.

**Results:** Full trip = 0.209 seconds and full reset = 15.5 seconds if current goes to zero.

In Figure 4-1,
- \( T_A = 0.209 \) seconds (relay was at reset).
- \( T_B = \) value < \( T_A \) because rewind has not gone to zero.
- \( T_C = \) value < \( T_A \) because rewind has not gone to zero.

![Figure 4-1. Coordination Timing Diagram](https://www.ElectricalPartManuals.com)

Equation for time to trip during rewind (before relay is reset).

\[ T_{\text{Trip This Occurrence}} = \frac{(\text{Full Trip}) (\text{Rewind Time})}{\text{Full Rewind}} \]

Second Operation

\[ T_B = \frac{(0.209)(3)}{15.5} \]

\[ T_B = 0.040 \text{ seconds} \]

Third Operation

\[ T_C = \frac{(0.209)(11.96)}{15.5} \]

\[ T_C = 0.161 \text{ seconds} \]
CONNECTIONS

Typical ac input connections for the BE1-50/51B-214/-215/-223/-225 are shown in Figure 4-2. Typical dc control connections for the BE1-50/51B-214/-225 are shown in Figure 4-3. Typical dc control connections for the BE1-50/51B-215 are shown in Figure 4-4. Typical dc control connections for the BE1-50/51B-223 are shown in Figure 4-5. Refer to the block diagrams in Section 3 for relay internal connections.

MAINTENANCE

BE1-50/51B-214/-215/-223/-225 overcurrent relays require no preventive maintenance. However, periodic checks should be performed according to scheduled practices. A recommended periodic test is provided in Section 5. If the relay fails to function properly, contact the Technical Sales Support Department of Basler Electric.

STORAGE

This device contains long-life aluminum electrolytic capacitors. For devices that are not in service (spares in storage), the life of these capacitors can be maximized by energizing the device for 30 minutes once per year.

SECTION 5 • TESTING

GENERAL
Dielectric testing, operational testing, and periodic testing are described in the following paragraphs.

DIELECTRIC TEST
In accordance with IEC 255-5 and IEEE C37.90-1989, one-minute dielectric (high potential) tests may be performed as follows:
- All circuits to ground: 2,828 Vdc or 2,000 Vac
- Input to output circuits: 2,828 Vdc or 2,000 Vac
Output contacts are surge protected.

OPERATIONAL TEST PROCEDURE
The following procedures verify operation of relays BE1-50/51B-214/-215/-223 (5 ampere model) and BE1-50/51B-225 (1 ampere model). The test setup of Figures 5-1 and 5-2 (BE1-50/51B-214/-225) are intended primarily as an illustration of the principles involved. The BE1-50/51B-215 is illustrated in Figures 5-3 and 5-4. The BE1-50/51B-223 is illustrated in Figures 5-5 and 5-6. Other test setups known to be capable of testing with the stated and implied tolerances (including equipment specifically designed for testing relays) may be used.

Test Equipment Required
- Current source with a range from 0 to 20 Aac (sensing input current)
- AC or DC voltage source (target operation)
- Timer or counter

CAUTION
To ensure proper timing during testing, before each test, remove the current from the unit for R times D seconds (refer to Section 1, Specifications, Time Reset for R and D definitions).

Figure 5-6. Target Operational Test Setup, BE1-50/51B-223
Test Procedure, Models BE1-50/51B-214/-215/-223 (Five Ampere Sensing Input)

**Time Pickup Test**

Perform preliminary setup:
- Connect test setup as shown in Figure 5-1 (BE1-50/51B-214), Figure 5-3 (BE1-50/51B-215), or Figure 5-5 (BE1-50/51B-223).
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON and SW3-4 to ON.
- Set TIME DIAL to 0.0.
- Set CURVE to S
- Set TIME PICKUP to 0.5.
- Set INST PICKUP to 90.

Step 1. Slowly increase current to terminals 5 and 6. PICKUP LED should turn RED at a maximum input current of 0.550 ampere.

Step 2. Decrease input current until PICKUP LED turns GREEN then OFF.

Step 3. Set TIME PICKUP to 2.2.

Step 4. Slowly increase current to terminals 5 and 6. PICKUP LED should change from GREEN to RED at an input current of 2.131 to 2.269 amperes.

Step 5. Decrease input current until PICKUP LED turns OFF.

**INST Pickup Test**

Perform preliminary setup:
- Connect test setup as shown in Figure 5-1 (BE1-50/51B-214), Figure 5-3 (BE1-50/51B-215), or Figure 5-5 (BE1-50/51B-223).
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 0.0.
- Set CURVE to S
- Set TIME PICKUP to 15.9.
- Set INST PICKUP to 01.

Step 1. Slowly increase current to terminals 5 and 6. INST contacts should close at an input current of 0.955 to 1.045 amperes.

Step 2. Decrease input current until INST output contacts open.

Step 3. Set INST PICKUP to 08.

Step 4. Slowly increase current to terminals 5 and 6. INST contacts should close at an input current of 7.815 to 8.185 amperes.

Step 5. Decrease input current until INST output contacts open.

**Time Dial Test**

Perform preliminary setup:
- Connect test setup as shown in Figure 5-1 (BE1-50/51B-214), Figure 5-3 (BE1-50/51B-215), or Figure 5-5 (BE1-50/51B-223).
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 4.5.
- Set CURVE to S

**NOTE**

When testing TIME overcurrent functions, INST PICKUP settings of 00 will affect the calibration of the TIME functions. TIME PICKUP settings of 00 also affect INST functions.
Step 1. Prepare to apply 1.5 amperes input current to terminals 5 and 6 and record the elapsed time from when current is applied until TIME output contacts close.

Step 2. Apply the current (step from 0 to 1.5 amperes) and record the elapsed time. Elapsed time should be 0.345 to 0.424 seconds. (This tolerance is greater than ±2% because it is the accumulation of both pickup and timing tolerances.)

Step 3. Remove input current.

**Target Test**

Perform preliminary setup:

- Connect test setup as shown in Figure 5-2 (BE1-50/51B-214), Figure 5-4 (BE1-50/51B-215), or Figure 5-6 (BE1-50/51B-223).
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 4.5.
- Set CURVE to S
- Set TIME PICKUP to 1.0.
- Set INST PICKUP to 90.

Step 1. Set voltage source to provide a target current of 1.0 ampere.

Step 2. Apply 5 amperes input current to terminals 5 and 6. Check that the TIME target operates.

Step 3. Remove input current and reset target.

Step 4. Set TIME PICKUP to 15.9 and set INST PICKUP to 01.

Step 5. Set voltage source to provide a target current of 1.0 ampere.

Step 6. Apply 5 amperes input current to terminals 5 and 6. Check that the INST target operates.

Step 7. Remove input current and reset targets.

**Manual Trip Test**

Perform preliminary setup:

- Connect test setup as shown in Figure 5-2 (BE1-50/51B-214), Figure 5-4 (BE1-50/51B-215), or Figure 5-6 (BE1-50/51B-223).
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 4.5.
- Set CURVE to S
- Set TIME PICKUP to 1.0.
- Set INST PICKUP to 01.

**WARNING!**

Trip circuit voltage is present at the front panel test points. When shorting the test points, use insulated jumpers to avoid contact with these voltages.

Step 1. Set voltage source to provide a target current of 1.0 ampere.

Step 2. Apply 0.9 ampere input current to terminals 5 and 6. (0.9 ampere provides input power but stays below pickup.)

Step 3. Connect a jumper between TIME MANUAL TRIP test points. Check that TIME target operates.

Step 4. Connect a jumper between INST MANUAL TRIP test points. Check that INST target operates.

Step 5. Reset targets.
**Integrating Reset Test**

Perform preliminary setup:

- Connect test setup as shown in Figure 5-1 (BE1-50/51B-214), Figure 5-3 (BE1-50/51B-215), or Figure 5-5 (BE1-50/51B-223).
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 9.9.
- Set CURVE to V.
- Set TIME PICKUP to 1.0.
- Set INST PICKUP to 90.

Step 1. Set voltage source to provide a target current of 1.0 ampere.

Step 2. Read all of Step 3 before beginning Step 3.

Step 3. Apply 4.0 amperes input current to terminals 5 and 6. After the unit trips, remove the input current for 29 ±0.25 seconds, then reapply the 4.0 amperes input current. Record the elapsed time from the re-application of input current to the output retrip.

**Result:** Elapsed time should be 2.08 ±0.4 seconds.

**Test Procedure, Model BE1-50/51B-225 (One Ampere Sensing Input)**

**Time Pickup Test**

Perform preliminary setup:

- Connect test setup as shown in Figure 5-1.
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON and SW3-4 to ON.
- Set TIME DIAL to 0.0.
- Set CURVE to S
- Set TIME PICKUP to 0.5.
- Set INST PICKUP to 18.0.

Step 1. Slowly increase current to terminals 5 and 6. PICKUP LED should turn RED at a maximum input current of 0.110 ampere.

Step 2. Decrease input current until PICKUP LED turns GREEN then OFF.

Step 3. Set TIME PICKUP to 0.44.

Step 4. Slowly increase current to terminals 5 and 6. PICKUP LED should change from GREEN to RED at an input current of 0.426 to 0.454 amperes.

Step 5. Decrease input current until PICKUP LED turns OFF.

**INST Pickup Test**

Perform preliminary setup:

- Connect test setup as shown in Figure 5-1.
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 0.0.
- Set CURVE to S
- Set TIME PICKUP to 3.18.
- Set INST PICKUP to 0.2

Step 1. Slowly increase current to terminals 5 and 6. INST contacts should close at an input current of 0.191 to 0.209 amperes.

Step 2. Decrease input current until INST output contacts open.

Step 3. Set INST PICKUP to 08.

Step 4. Slowly increase current to terminals 5 and 6. INST contacts should close at an input current of 1.563 to 1.637 amperes.
Step 5. Decrease input current until INST output contacts open.

**Time Dial Test**

Perform preliminary setup:
- Connect test setup as shown in Figure 5-1.
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 4.5.
- Set CURVE to S
- Set TIME PICKUP to 0.2.
- Set INST PICKUP to 18.0.

Step 1. Prepare to apply 0.3 amperes input current to terminals 5 and 6 and record the elapsed time from when current is applied until TIME output contacts close.

Step 2. Apply the current (step from 0 to 0.3 amperes) and record the elapsed time. Elapsed time should be 0.345 to 0.424 seconds. (This tolerance is greater than ±2% because it is the accumulation of both pickup and timing tolerances.)

Step 3. Remove input current.

**Target Test**

Perform preliminary setup:
- Connect test setup as shown in Figure 5-2.
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 4.5.
- Set CURVE to S
- Set TIME PICKUP to 0.2.
- Set INST PICKUP to 19.8.

Step 1. Set voltage source to provide a target current of 1.0 ampere.

Step 2. Apply 1 ampere input current to terminals 5 and 6. Check that the TIME target operates.

Step 3. Remove input current and reset target.

Step 4. Set TIME PICKUP to 3.18 and set INST PICKUP to 0.2.

Step 5. Set voltage source to provide a target current of 1.0 ampere.

Step 6. Apply 1 ampere input current to terminals 5 and 6. Check that the INST target operates.

Step 7. Remove input current and reset target.

**Manual Trip Test**

Perform preliminary setup:
- Connect test setup as shown in Figure 5-2.
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 4.5.
- Set CURVE to S
- Set TIME PICKUP to 0.2.
- Set INST PICKUP to 0.2.

**WARNING!**

Trip circuit voltage is present at the front panel test points. When shorting the test points, use insulated jumpers to avoid contact with these voltages.

Step 1. Set voltage source to provide a target current of 1.0 ampere.
Step 2. Apply 0.15 ampere input current to terminals 5 and 6. (0.15 ampere provides input power but stays below pickup.)

Step 3. Connect a jumper between TIME MANUAL TRIP test points. Check that TIME target operates.

Step 4. Connect a jumper between INST MANUAL TRIP test points. Check that INST target operates.

Step 5. Reset targets.

**Integrating Reset Test**

Perform preliminary setup:
- Connect test setup as shown in Figure 5-1.
- Insure that SW3 switches are set: SW3-1 for the operating frequency, SW3-2 to OFF, SW3-3 to ON, and SW3-4 ON.
- Set TIME DIAL to 4.5.
- Set CURVE to I.
- Set TIME PICKUP to 0.20.
- Set INST PICKUP to 18.0.

**Step 1.** Set voltage source to provide a target current of 1.0 ampere.

**Step 2.** Read all of Step 3 before beginning Step 3.

**Step 3.** Apply 0.8 amperes input current to terminals 5 and 6. After the unit trips, remove the input current for 20 ±0.25 seconds, then reapply the 0.8 amperes input current. Record the elapsed time from the re-application of input current to the output retrip.

**Result:** Elapsed time should be 1.55 ±0.3 seconds.

---

**SETTING THE RELAY**

Select the desired relay settings before putting the relay into service. Changing pickup current settings while the relay is in service may cause tripping.

**PERIODIC TESTS**

**General**

All relays should be tested periodically to identify and correct any problems that are found.

Single phase relays such as the BE1-50/51B-214/-215/-223/-225 are normally used in groups of four (three phase and ground) on the protected circuit. This relay scheme allows each unit to be withdrawn one at a time for testing purposes without losing protection. Only three are required at any one time to sense all types of faults on a grounded wye system. Refer to Figures 5-1 through 5-4 for recommended test setups.

**Periodic Test**

Periodic testing should consist of the following procedures.

**Step 1.** Verify that the instantaneous pickup is within ±2% of the value set on the dials. Pickup occurs when the INST output contacts close.

**Step 2.** Verify that the time pickup is within ±2% of the value set on the dials. Pickup occurs when the LED turns GREEN then RED.

**Step 3.** Verify that the time to trip for the curve and time dial settings at a multiple of six is the same as the time given on the characteristic curve. Refer to Section 1 for the characteristics curves.

**Step 4.** Verify that the time to trip for the instantaneous element at a pickup multiple of 2 is not greater than the time given on the instantaneous characteristic curve. Refer to Section 1 for the instantaneous characteristic curve.

**Step 5.** Verify that the targets operate with one ac ampere of trip current in the trip circuits and that they can be reset using the RESET BUTTON.

Figure A-13. Time Characteristic Curve, V2-Very Inverse (SW3-3 ON, Similar to GE IAC 53) ... A-13
Figure A-14. Time Characteristic Curve, E2-Extremely Inverse (SW3-3 ON, Similar to GE IAC 77) A-14
APPENDIX A • TIME CHARACTERISTIC CURVES

TIME CHARACTERISTIC CURVES
Figures A-1 through A-14 illustrate the time characteristic curves that are programmed into the nonvolatile memory of this relay.

Figure A-1. Time Characteristic Curve, S-Short Inverse
(SW3-3 OFF, Similar to ABB CO-2)
Figure A-2. Time Characteristic Curve, L-Long Inverse (SW3-3 OFF, Similar to ABB CO-5)
Figure A-3. Time Characteristic Curve, D-Definite Time
(Similar to ABB CO-6)
Figure A-4. Time Characteristic Curve, M-Moderately Inverse
(Similar to ABB CO-7)
Figure A-5. Time Characteristic Curve, I-Inverse
(SW3-3 OFF, Similar to ABB CO-8)
Figure A-6. Time Characteristic Curve, V-Very Inverse
(SW3-3 OFF, Similar to ABB CO-9)
Figure A-7. Time Characteristic Curve, E-Extremely Inverse
(SW3-3 OFF, Similar to ABB CO-11)
Figure A-8. Time Characteristic Curve, BS142-B
(BS142 Very Inverse)
Figure A-9. Time Characteristic Curve, BS142-C
(BS142 Extremely Inverse)
Figure A-10. Time Characteristic Curve, S2-Short Inverse
(SW3-3 ON, Similar to GE IAC 55)
Figure A-11. Time Characteristic Curve, L2-Long Inverse
(SW3-3 ON, Similar to GE IAC 66)
Figure A-12. Time Characteristic Curve, I2-Inverse
(SW3-3 ON, Similar to GE IAC 51)
Figure A-13. Time Characteristic Curve, V2-Very Inverse
(SW3-3 ON, Similar to GE IAC 53)
Figure A-14. Time Characteristic Curve, E2-Extremely Inverse
(SW3-3 ON, Similar to GE IAC 77)
