# SIEMENS

**User Documentation** 

#### Warnings, Cautions and Notes

The following Warnings, Cautions and Notes are provided for your safety and as a means of preventing damage to the product or components in the machines connected. **Specific Warnings, Cautions and Notes** that apply to particular activities are listed at the beginning of the relevant chapters and are repeated or supplemented at critical points throughout these sections. Please read the information carefully, since it is provided for your personal safety and will also help prolong the service life of your MICROMASTER 430 Inverter and the equipment you connect to it.

#### WARNING

- This equipment contains dangerous voltages and controls potentially dangerous rotating mechanical parts. Non-compliance with **Warnings** or failure to follow the instructions contained in this manual can result in loss of life, severe personal injury or serious damage to property.
- Only suitable qualified personnel should work on this equipment, and only after becoming familiar with all safety notices, installation, operation and maintenance procedures contained in this manual. The successful and safe operation of this equipment is dependent upon its proper handling, installation, operation and maintenance.
- The DC link capacitors remain charged for five minutes after power has been removed. It is not permissible to open the equipment until 5 minutes after the power has been removed. The drive unit discharges itself during this time.
- This equipment is capable of providing internal motor overload protection in accordance with UL508C section 42. Refer to P0610 and P0335, i<sup>2</sup>t is ON by default. Motor overload protection can also be provided using an external PTC or KTY84.
- This equipment is suitable for use in a circuit capable of delivering not more than 10,000 (Frame Size C) or 42,000 (Frame Sizes D to GX) symmetrical amperes (rms), for a maximum voltage of 460 V when protected by an H, J or K type fuse, a circuit breaker or self-protected combination motor controller (for more details see Operating Instructions Appendix F).
- Use Class 1 60/75 °C copper wire only with the cross-sections as specified in the Operating Instructions.
- The mains input, DC and motor terminals, can carry dangerous voltages even if the inverter is inoperative. Always wait 5 minutes to allow the unit to discharge after switching off before carrying out any installation work.

#### NOTE

- Before installing and commissioning, please read these safety instructions and warnings carefully and all the warning labels attached to the equipment.
- Please ensure that all of the warning labels are kept in a condition so that they can be easily read and replace missing or damaged labels.
- Maximum permissible surrounding ambient temperature is 40 °C at 100 % permissible output current

# 1 Installation

## **1.1** Clearance distances for mounting

The inverters can be mounted adjacent to each other. When mounting inverters one above the other, the specified environmental conditions must not be exceeded.

Independent of this, these minimum distances must be observed.

- Frame Size C above and below 100 mm
- Frame Size D, E above and below 300 mm
- Frame Size F above and below 350 mm
- Frame Size FX, GX above 250 mm below 150 mm in front 40 mm (FX), 50 mm (GX)

## 1.2 Mounting dimensions

Control terminals of MICROMASTER 430

MM

# 3 Factory setting

The MICROMASTER 430 frequency inverter is set in the factory so that it can be operated without any additional parameterization. To do this, the motor parameters set in the factory (P0304, P0305, P0307, P0310), that correspond to a 4-pole 1LA7 Siemens motor, must match the rated data of the connected motor (refer to the rating plate).

#### Further factory setting:

- Command sources P0700 = 2 (Digital input, see Fig. 3-1)
- Setpoint source P1000 = 2 (Analog input, see Fig. 3-1)
- Motor cooling P0335 = 0
- Motor current limit P0640 = 110 %
- Min. frequencyP1080 = 0 Hz
- Max. frequency P1082 = 50 Hz
- Ramp-up time P1120 = 10 s
- Ramp-down time P1121 = 10 s
- Control modeP1300 = 0

 DIP1(1,2) = OFF

## 50/60 Hz DIP switch

The default motor base frequency of the MICROMASTER inverter is 50 Hz. For motors, which are designed for a base frequency of 60 Hz, the inverters can be set to this frequency using the DIP50/60 switch.

- OFF position: European defaults (Rated motor frequency = 50 Hz, Power in kW etc.)
- ON position: North American defaults (Rated motor frequency = 60 Hz, Power in hp etc.)

# 4 Communications

## 4.1 Establishing communications MICROMASTER 430 ⇔ STARTER

The following optional components are additionally required in order to establish communications between STARTER and MICROMASTER 430:

- PC <-> frequency inverter connecting set
- BOP-2 if the USS standard values (refer to Section 6.3.1 "Serial Interface (USS)") are changed in the MICROMASTER 430 frequency inverter

#### NOTE

- > The hardware must be carefully checked in order to ensure that it is correctly located and connected.
- When in the error-free state, the orange and green LEDs are continuously lit (steady light) at the BOP link.
- The COM interface must be selected on a computer-for-computer basis (port COM2 should be selected for a field PG with I box).
- The baud rate test executed by the PC cannot always determine a baud rate that deviates from the factory setting; if necessary, this can be determined by changing the setting on the PC interface (PC port) side.
- We recommend a BOP-2 in cases such as these so that parameters can be quickly and simply checked.

PC <-> frequency inverter connecting set	MICROMASTER 430
	USS settings, refer to 6.3.1 "Serial Interface (USS)"
	STARTER
	Menu, Options> Set PG/PC interface > Select "PC COM-Port (USS)"> Properties> Interface "COM1", select a baud rate
	NOTE
	The USS parameter settings in the MICROMASTER 430 frequency inverter and the settings in STARTER must match!

#### 5 **BOP-2** (Option) 50.00 5.1 **Buttons and their Functions** Panel/ Function Effects **Button** Indicates r 0000 The LCD displays the settings currently used by the inverter. Status Pressing the button starts the inverter. This button is disabled by default. Start Activate the button: P0700 = 1 or P0719 = 10 ... 16 inverter OFF1 Pressing the button causes the motor to come to a standstill at the selected ramp down rate. This button is disabled by default. Activate the button: see button "Start inverter" Stop Pressing the button twice (or once long) causes the motor to coast inverter OFF2 to a standstill. This function is always enabled (independent of P0700 or P0719). Manual operation is selected by pressing the button. The drive inverter is then controlled from the sources P0700[1] (command source) or P1000[1] (setpoint source). The following applies for the pre-setting: Manual Manual operation de-activated (CDS 2 de-activated) mode CDS 2 : P0700[1] = 1 (BOP-2) P1000[1] = 1 (MOP) The automatic mode is selected by pressing the button. The drive inverter is then controlled from the sources P0700[0] (command source) or P1000[0] (setpoint source). The following applies for the pre-setting: Automatic Automatic mode activated (CDS 1 activated) mode CDS 1: P0700[0] = 2 (terminals) P1000[0] = 2 (ADC) This button can be used to view additional information. It works by pressing and holding the button. It shows the following, starting from any parameter during operation: 1. DC link voltage (indicated by d – units V). 2. output current. (A) 3. output frequency (Hz) output voltage (indicated by o – units V). The value selected in P0005 (If P0005 is set to show any of the above 5. (1 - 4) then this will not be shown again). Functions Additional presses will toggle around the above displays. **Jump Function** From any parameter (rxxxx or Pxxxx) a short press of the Fn button will immediately jump to r0000, you can then change another parameter, if required. Upon returning to r0000, pressing the Fn button will return you to your starting point. Acknowledgement If alarm and fault messages are present, then these can be acknowledged by pressing key Fn. Access Pressing this button allows access to the parameters. parameters Increase Pressing this button increases the displayed value. value Decrease Pressing this button decreases the displayed value. value

#### CAUTION

A MICROMASTER 430 can only be operated using the BOP-2. If an attempt is made to use either a BOP or AOP, then \_\_\_\_\_ is displayed.

# 5.2 Changing parameters using as an example P0004 "Parameter filter function"

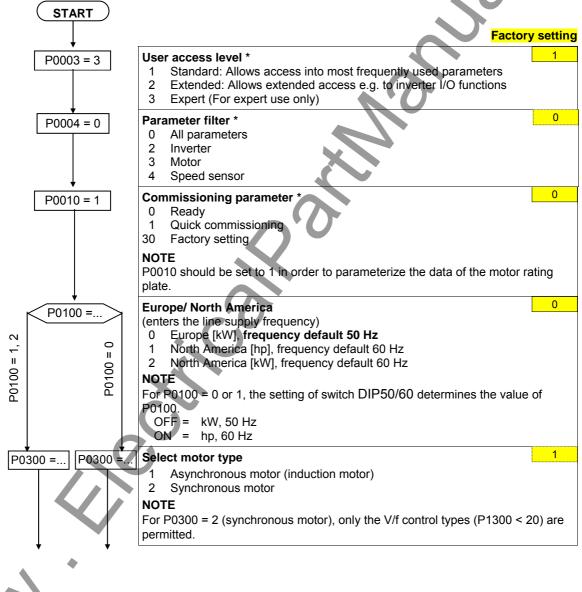

St	ер	Result on the display
1	Press P in order to access the parameter	
2	Press O until P0004 is displayed	P0004
3	Press  Pin order to reach the parameter value level	P(1) Hz
4	Press O or O in order to obtain the required value	٦
5	Press P to acknowledge the value and to save the value	P(1) P0004
6	The user can only see the command parameters.	

# 6 Commissioning

## 6.1 Quick commissioning

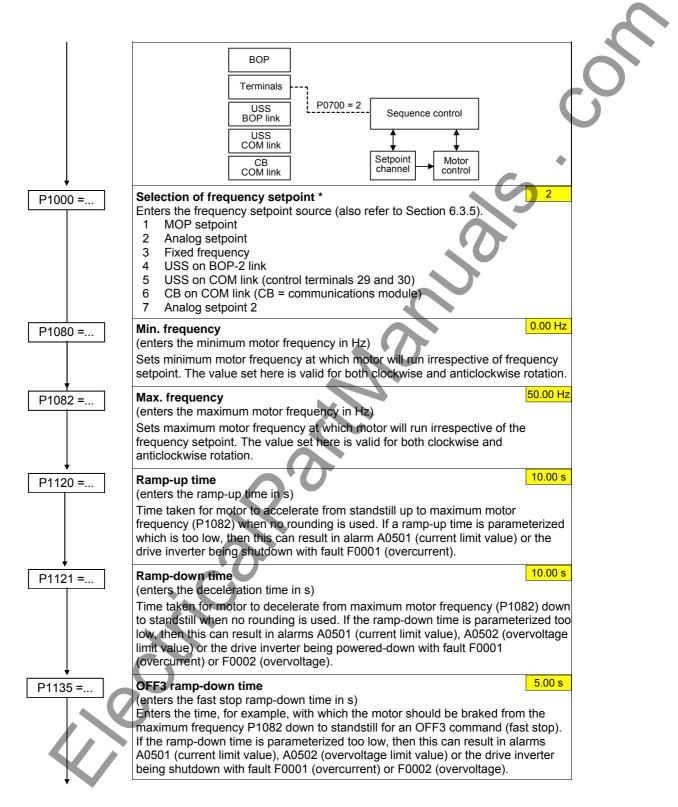

The frequency inverter is adapted to the motor using the quick commissioning function and important technological parameters are set. The quick commissioning shouldn't be carried-out if the rated motor data saved in the frequency inverter (4-pole 1LA Siemens motor, star circuit configuration  $\cong$  frequency inverter (FU)-specific) match the rating plate data.

Parameters, designated with a \* offer more setting possibilities than are actually listed here. Refer to the parameter list for additional setting possibilities.

Section "Commissioning the application" (refer to Section 6.3). We recommend this procedure for drives with a high dynamic response.

MM

## 6.2 Motor data identification START Factory setting Ambient motor temperature (entered in °C) 20 P0625 = ? The motor ambient temperature is entered at the instant that motor data is being determined (factory setting: 20 °C). The difference between the motor temperature and the motor ambient | Motor temp. - P0625| temperature P0625 must lie in the tolerance range of approx. ± 5 °C. If this is $\leq 5 \,^{\circ}\text{C}$ ? not the case, then the motor data identification routine can only be carried-out after the motor has cooled down. yes no Allow the motor to cool down Select motor data identification with P1910 = 1 0 P1910 = 1 p1910 = 1: Identifies the motor parameter with parameter change. When p1910 = 1 is selected, Alarm A0541 (motor data identification active) A0541 is output, and internally p0340 is set to 3. ON Starts the motor data identification run with p1910 = 1 The measuring operation is initiated with the continuous (steady-state) ON command. The motor aligns itself and current flows through it. After the motor data identification routine has been completed, p1910 is reset (p1910 = 0, motor data identification routine inhibited) and Alarm A0541 is cleared (deleted). In order to set the frequency inverter into a defined state, an OFF1 command OFF1 must be issued before the next step. END MM

## 6.3 Commissioning the application

An application is commissioned to adapt/optimize the frequency inverter - motor combination to the particular application. The frequency inverter offers numerous functions - but not all of these are required for the particular application. These functions can be skipped when commissioning the application. A large proportion of the possible functions are described here; refer to the parameter list for additional functions.

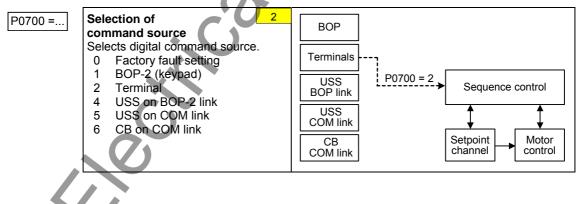

Parameters, designated with a \* offer more setting possibilities than are actually listed here. Refer to the parameter list for additional setting possibilities.

P0003 = 3	User access level * 1 Standard: Allows access into most frequently used parameters 2 Extended: Allows extended access e.g. to inverter I/O functions 3 Expert (For expert use only)	1

### 6.3.9 Fixed frequency (FF)

The fixed frequencies (P1001 - P1016) can be selected using the digital inputs (standard case), serial communication interfaces (ports) as well as using any BiCo parameter. For the digital inputs, the fixed frequencies can be selected using parameter P070x "function, digital input" (standard method) as well as also r0722 "status, digital inputs" (BiCo method).

When selecting fixed frequencies using digital inputs, the following applies:

Standard method ==> P070x = 15, 16, 17

15 = direct selection (binary-coded)

In this particular mode, the appropriate digital input always selects the associated fixed frequency, e.g.:

Digital input 3 = selects fixed frequency 3.

If several inputs are simultaneously active, then these are summed. An ON command is additionally required.

#### 16 = Direct selection + ON command (binary-coded + On / Off1)

In this mode, the fixed frequencies are selected as for 15, however these are combined with an ON command.

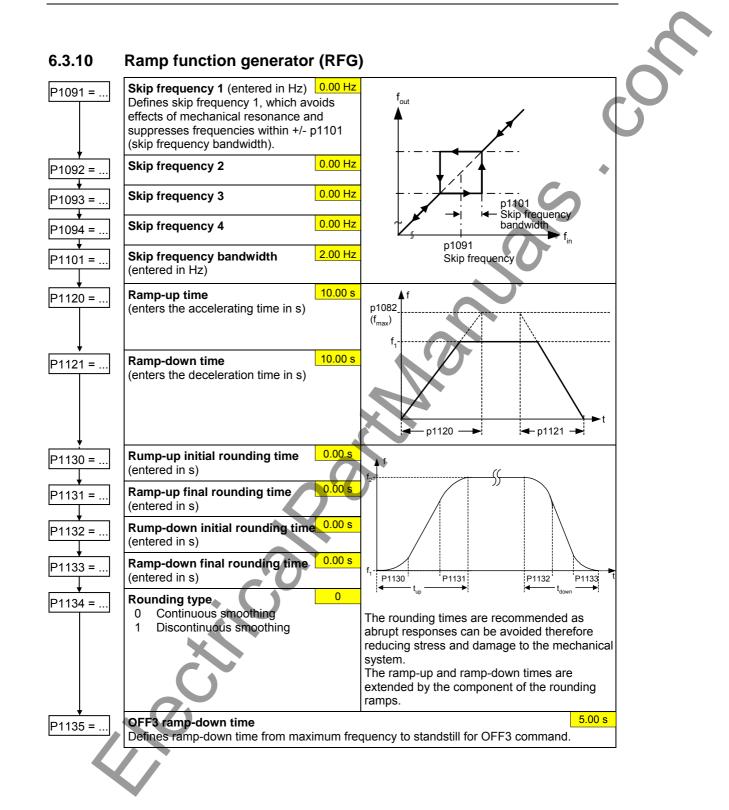

**17 = Binary coded selection + ON command (BCD-coded + On/ Off1)** The BCD-coded operating mode is effective for digital inputs 1 to 6.

• BiCo method ==> P070x = 99, P102x = 722.x, P1016 = 1, 2, 3

M

Fixed frequency 1 Can be directly selected via DIN1 (P070	1 = 15, 16)	0.00 Hz
<b>Fixed frequency 2</b> Can be directly selected via DIN2 (P0702	2 = 15, 16)	5.00 Hz

## 6.3.13 Motor protection

In addition to the thermal motor protection, the motor temperature is also included in the adaptation of the motor equivalent circuit diagram data. For MM430 the motor temperature can only be measured using a KTY84 sensor. For the parameter setting P0601 = 0,1, the motor temperature is calculated / estimated using the thermal motor model.

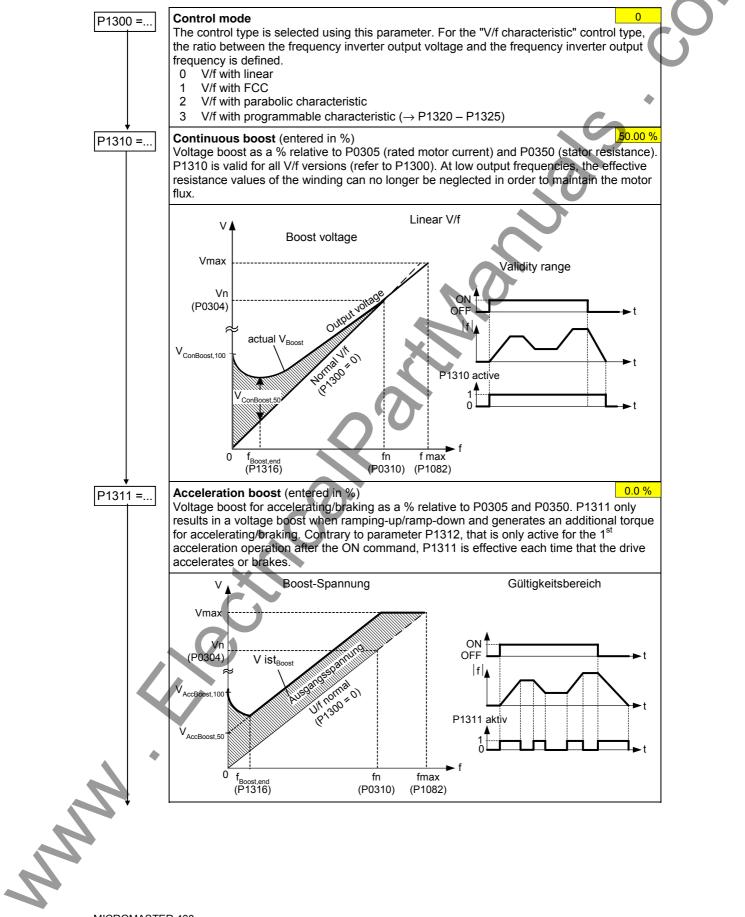

If the frequency inverter is permanently supplied with an external 24V voltage, then the motor temperature is also tracked/corrected using the motor temperature time constant – even when the line supply voltage is switched-out.

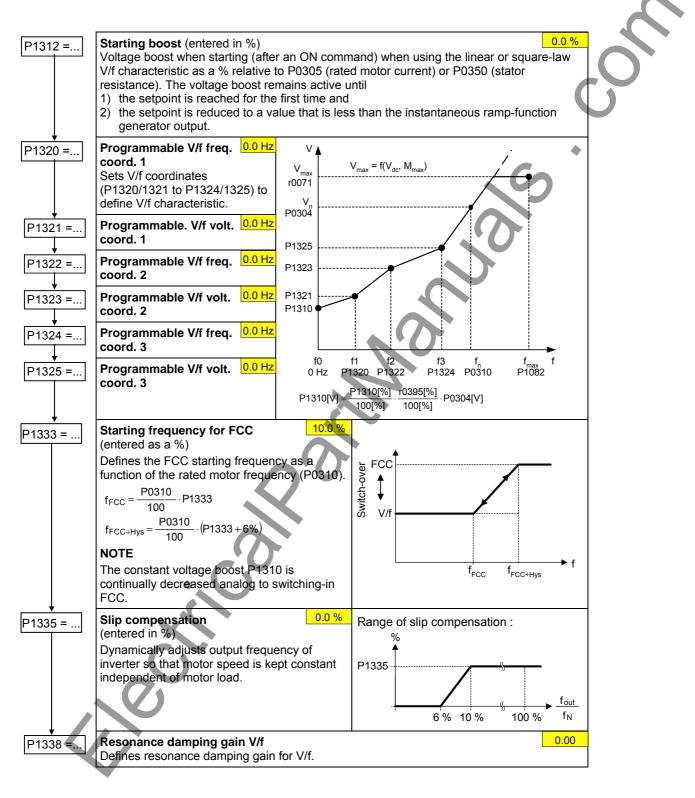

## 6.3.14 Encoder

### 6.3.16.3 Holding brake

- Series / commissioning for hazardous loads
  - lower the load to the floor
  - when replacing the frequency inverter, prevent (inhibit) the frequency inverter from controlling the motor holding brake (MHB)
  - secure the load or inhibit the motor holding brake control (so that the brake cannot be controlled) and then – and only then – carry-out quick commissioning / parameter download using the PC-based tool (STARTER)
- > Parameterize the weight equalization for hoisting gear applications
  - magnetizing time P0346 greater than zero
  - min. frequency P1080 should approximately correspond to the motor slip r0330 (P1080 ≈ r0330)
    - Adapt the voltage boost to the load (P1310, P1311)
- It is not sufficient to just select the status signal r0052 bit 12 "motor holding brake active" in P0731 – P0733. In order to activate the motor holding brake, in addition, parameter P1215 must be set to 1.
- It is not permissible to use the motor holding brake as operating brake. The reason for this is that the brake is generally only dimensioned/designed for a limited number of emergency braking operations.
- The brake closing / opening times can be taken from the appropriate manual. The following typical values have been taken from Motor Catalog M11 2003/2004, Page 2/51:

Motor size	Brake type	Opening time [ms]	Closing time [ms]
63	2LM8 005-1NAxx	25	56
71	2LM8 005-2NAxx	25	56
80	2LM8 010-3NAxx	26	70
90	2LM8 020-4NAxx	37	90
100	2LM8 040-5NAxx	43	140
112	2LM8 060-6NAxx	60	210
132	2LM8 100-7NAxx	50	270
160	2LM8 260-8NAxx	165	340
180	2LM8 315-0NAxx	152	410
200 225	2LM8 400-0NAxx	230	390

P1215 =...

#### Holding brake enable

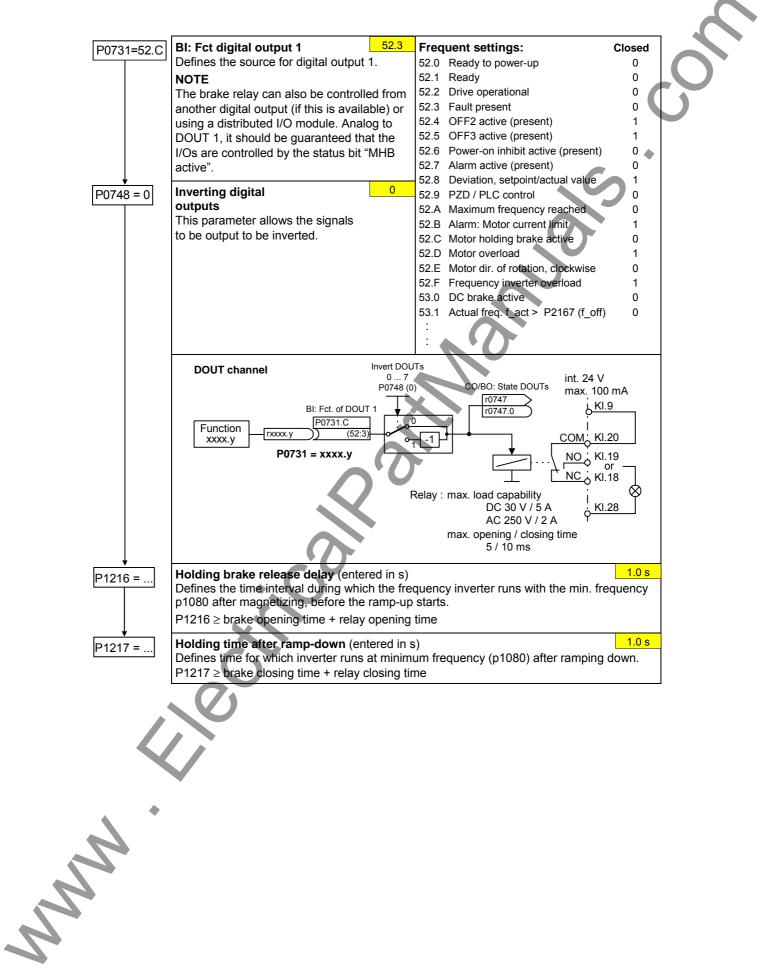

Enables/disables holding brake function (MHB).

- 0 Motor holding brake disabled
- 1 Motor holding brake enabled **NOTE**

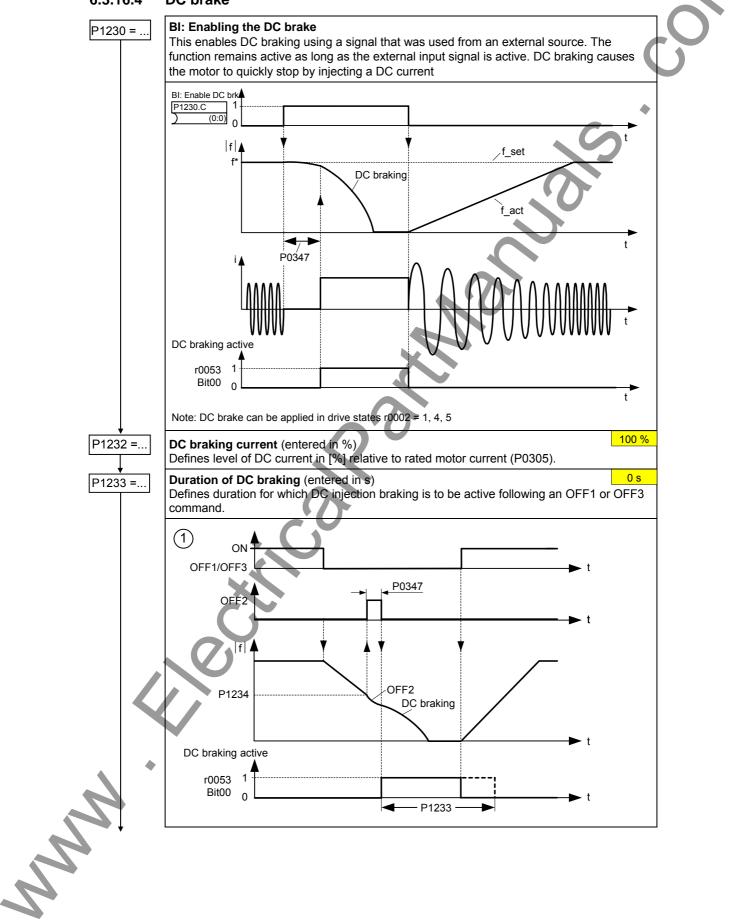

The following must apply when controlling the brake relay via a digital output: P0731 = 52.C (= 52.12) (refer to Section 6.3.4 "Digital outputs (DOUT)").

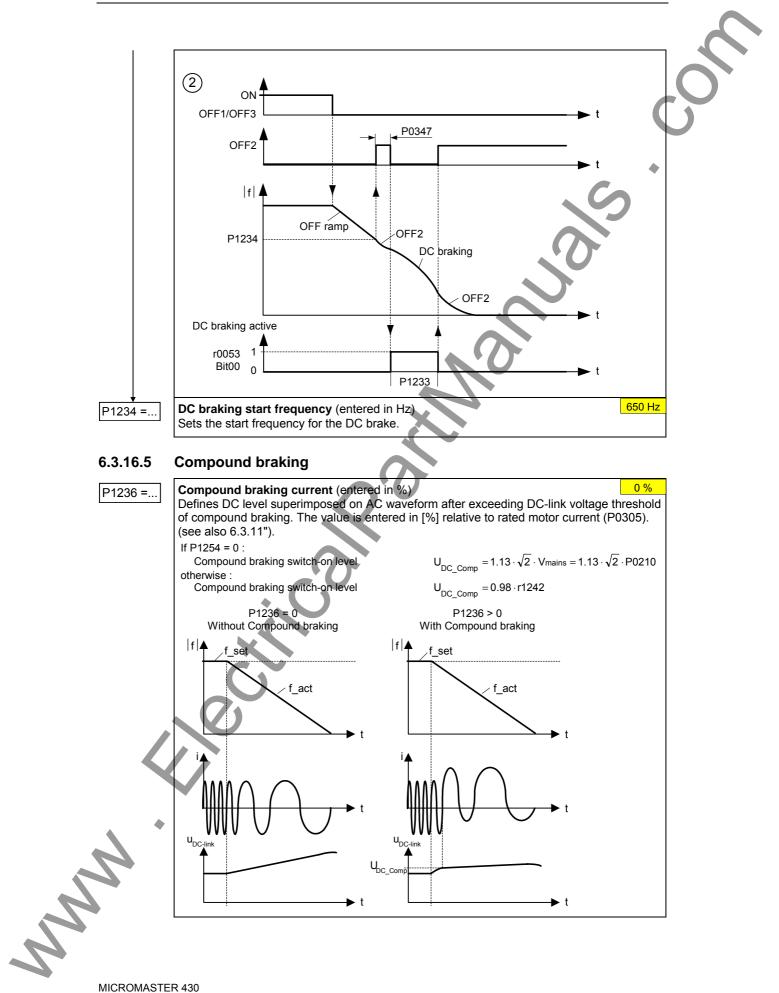

0

The way

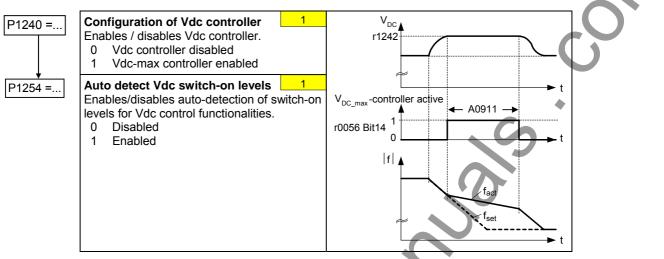

### 6.3.16.4 DC brake

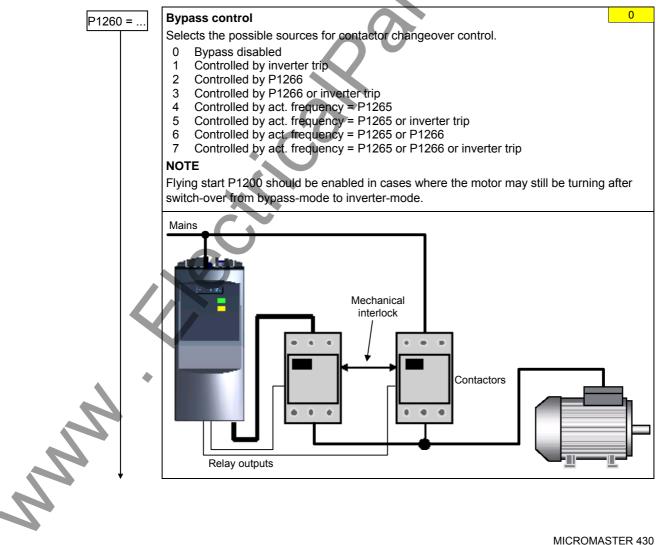

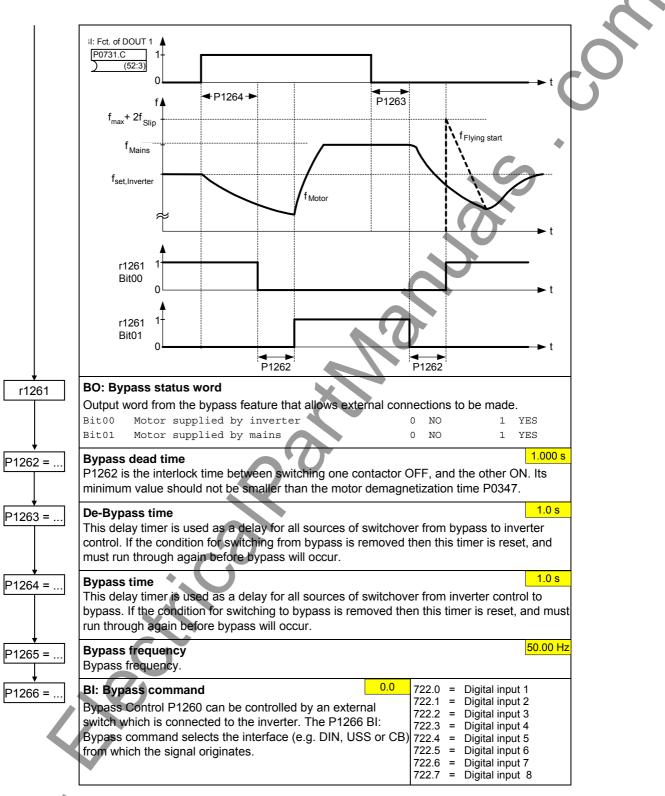

### 6.3.16.6 Vdc controller

### 6.3.16.7 Bypass

Bypass is used to described the condition when a motor is ran alternatively between a mains supply and the inverter. For example, the bypass circuit can be used to switch over from the inverter to a mains supply when the inverter is faulty. This function can also be used to ramp-up a large rotation mass using the inverter and then, at the correct speed, switching over to the mains supply.

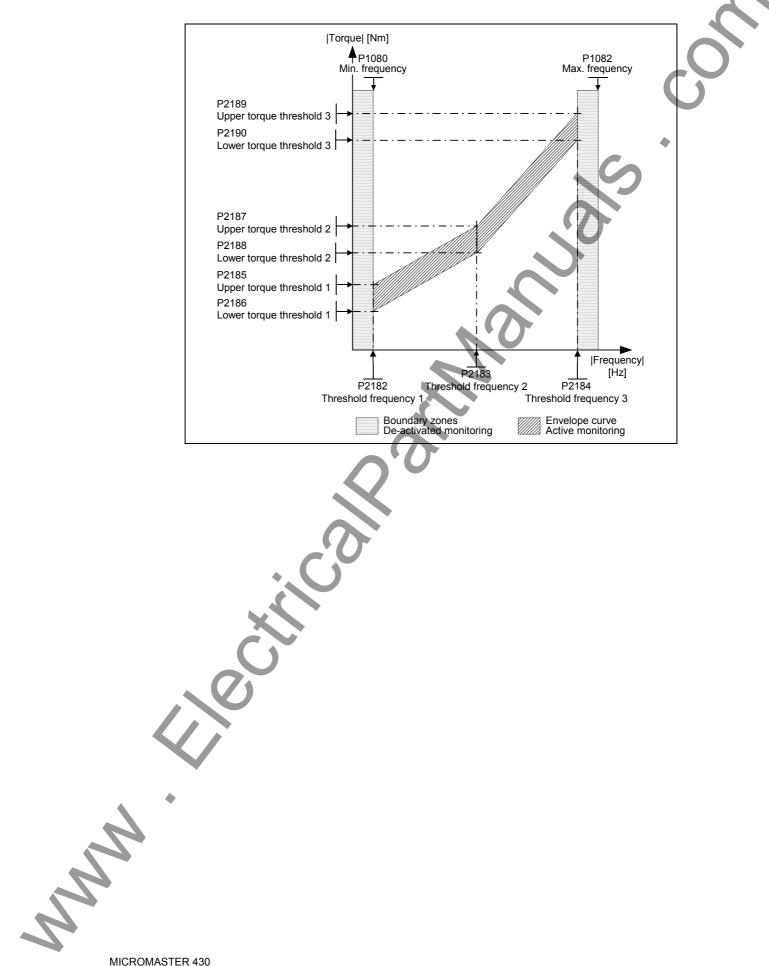

### 6.3.16.8 Load torque monitoring

This function monitors the transmission of force between a motor and driven load within a defined frequency range. Typical applications include, for example, detecting when a transmission belt breaks or detecting when a conveyor belt is in an overload condition.

For the load torque monitoring, the actual frequency/torque actual value is compared to a programmed frequency/torque characteristic (refer to P2182 – P2190). Depending on P2181, the system monitors whether the permissible torque curve is either exceeded or fallen below. If the actual value lies outside the tolerance bandwidth, then after the delay time P2192 has expired, either alarm A0952 is output or fault F0452.

P2181 =	Belt failure detection mode         Parameter P2181 activates or de-activates the load torque monitoring and defines the response to a load torque fault.         0       Belt failure detection disabled         1       Warning: Low torque / frequency         2       Warning: High torque / frequency         3       Warning: High / low torque / frequency         4       Trip: Low torque / frequency         5       Trip: High torque / frequency         6       Trip: High / low torque / frequency	0
P2182 =	Belt threshold frequency 1 Sets a frequency threshold 1 for comparing actual torque to torque the envelope for be failure detection.	<u>5.00</u> elt
P2183 =	Belt threshold frequency 2   Image: Comparison of the shold 2.	<mark>30.00</mark>
P2184 =	Belt threshold frequency 3 Sets a frequency threshold 3.	50.00
P2185 =	Upper torque threshold 1         99           Upper limit threshold value 1 for comparing actual torque.         99	<mark>9999.0</mark>
P2186 =	Lower torque threshold 1 Lower limit threshold value 1 for comparing actual torque.	0.0
P2187 =	Upper torque threshold 2 Upper limit threshold value 2 for comparing actual torque.	9999.0
P2188 =	Lower torque threshold 2 Lower limit threshold value 2 for comparing actual torque.	0.0
P2189 =	Upper torque threshold 3         90           Upper limit threshold value 3 for comparing actual torque.         90	9999.0
P2190 =	Lower torque threshold 3 Lower limit threshold value 3 for comparing actual torque.	0.0
P2192 =	Time delay for belt failure           P2192 defines a delay before warning/trip becomes active. It is used to eliminate ever caused by transient conditions. It is used for both methods of fault detection.	10 nts

## 6.3.16.9 PID controller

Process values can be controlled via PID control (e.g. pressure, liquid level). The process setpoint (PID setpoint) can be a fixed setpoint (e.g. PID-FF) or an analog setpoint (e.g. analog input). The current value of the process is determined by a sensor, which is connected to the inverter via an analog input.

### NOTE

- PID-FF or PID-MOP are build up like FF (refer to Section 6.3.9) or MOP (refer to Section 6.3.8).
- The parameters of PID-FF are in the parameter range P2201 P2228.
- For the PID-MOP parameters the range P2231 r2250 is valid.

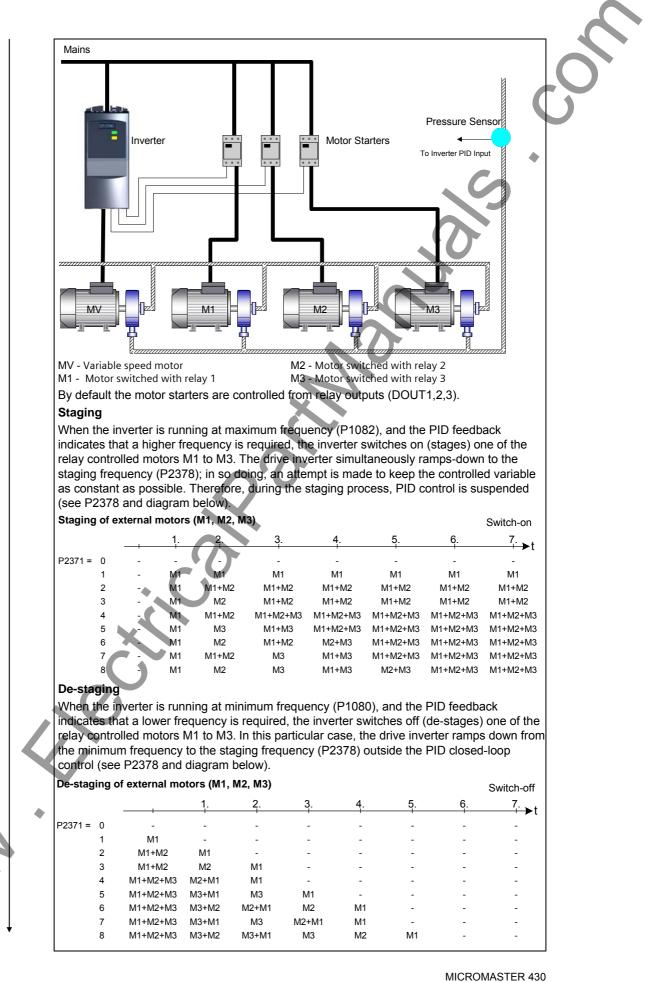

#### Example

Parameter	Parameter text	Example	
P2200	BI: Enable PID controller	P2200 = 1.0	PID controller active
P2253	CI: PID setpoint	P2253 = 2224	PID-FF1
P2264	CI: PID feedback	P2264 = 755	ADC
P2267	Max. PID feedback	P2267	Adapt to the application
P2268	Min. PID feedback	P2268	Adapt to the application
P2280	PID proportional gain	P2280	Determined by optimizing
P2285	PID integral time	P2285	Determined by optimizing
P2291	PID output upper limit	P2291	Adapt to the application
P2292	PID output lower limit	P2292	Adapt to the application

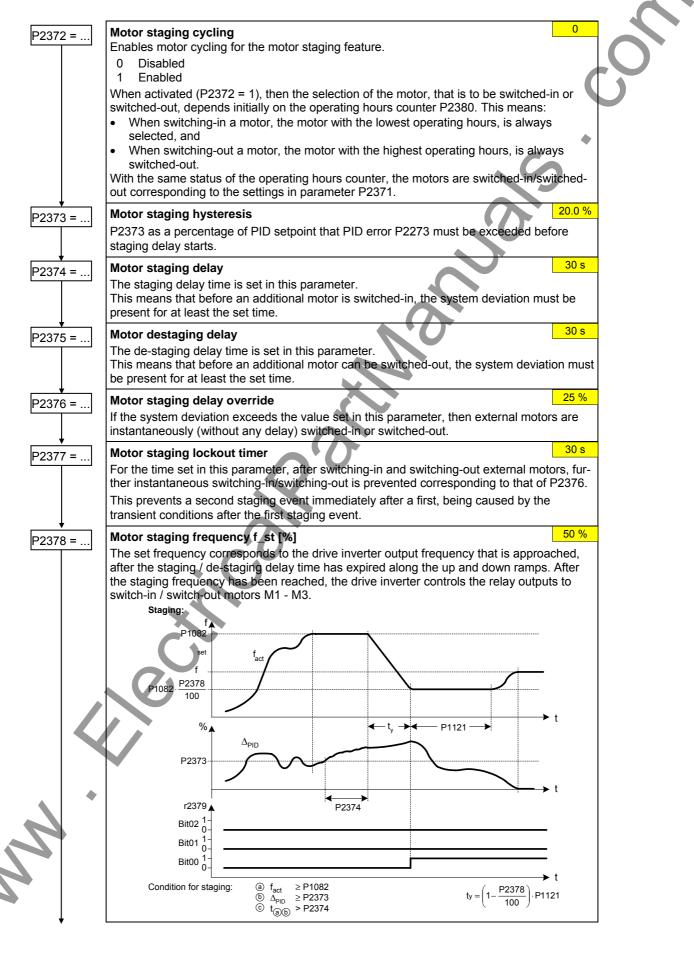

### 6.3.16.10 Staging

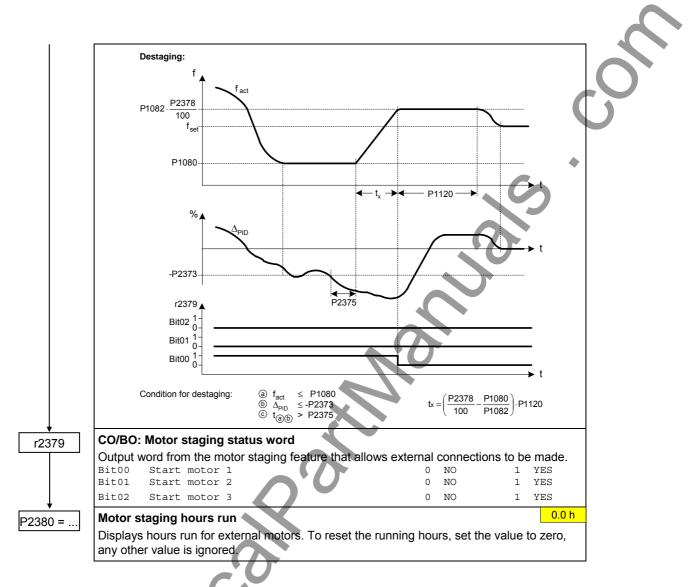

Motor staging allows the control of up to 3 additional staged pumps or fans, based on a PID control system. The complete system comprises a variable-speed pump/fan that is controlled by the drive inverter, and a maximum of 3 additional fixed-speed pumps/fans, that are controlled via contactors or motor starters. The contactors or motor starter are controlled by outputs from the inverter. The diagram below shows a typical pumping system. A similar system could be set up using fans and air ducts, instead of pumps and pipes.

-			
P2370 =	Motor staging stop mode		0
	Using this parameter, the stop mode of externation	rnal motors M1 - M3 is defined for an	
	OFF1 command.		
	0 Normal stop		
	1 Sequence stop		
	Staging-Configuration		0
1 201 1	Selects configuration of external motors (M1	M2 M2)	
	Selects configuration of external motors (in t	, IVIZ, IVIJ).	
	0 Motor staging disabled

## 6.3.17 Data sets

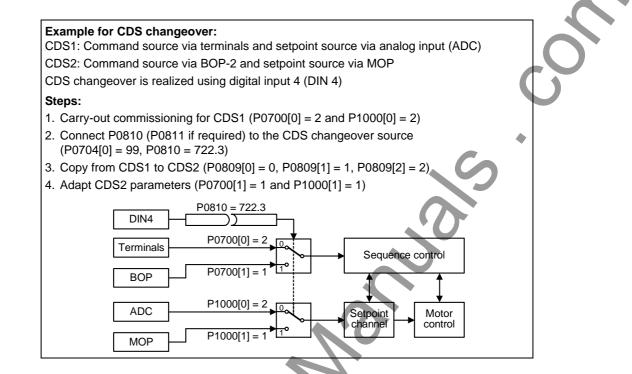

For many applications, it is advantageous, if several parameter settings can be simultaneously changed during operation or during operational readiness using an external signal. By using indexing, different settings can be saved under one parameter. These are then activated when the data set is changed-over. The following data sets are available:

- CDS Command Data Set
- DDS Drive Data Set

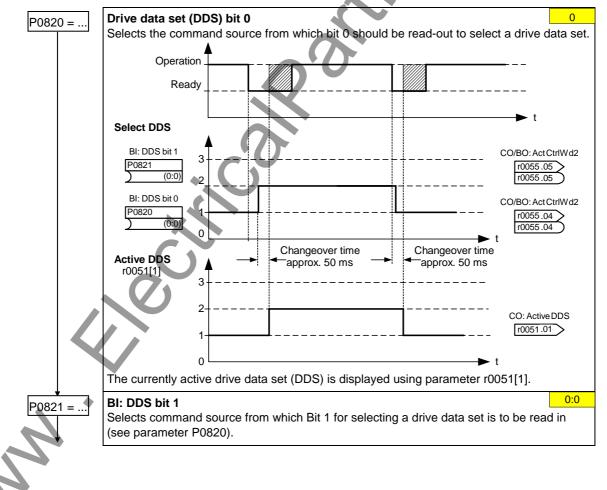

The "Hand/Auto" mode (refer to Chapter 5)) is a sub-set of the command data set.

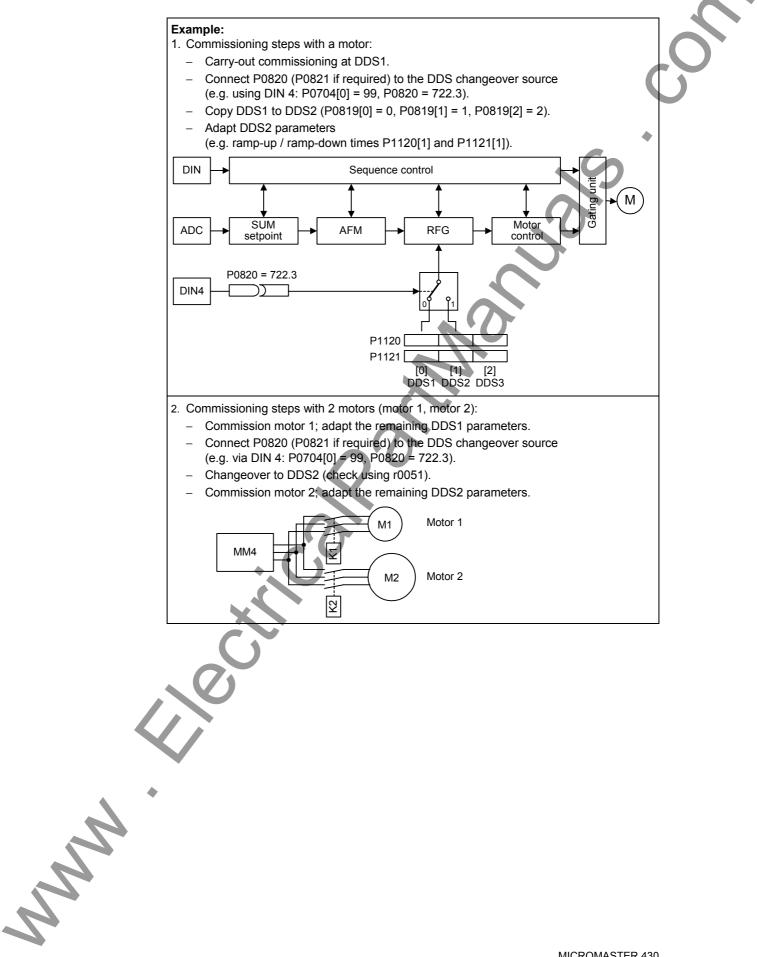

6.3.17.1 Command data set (Local/Remote)

### 6.3.17.2 Drive data set (DDS)

## 6.4 Series commissioning

An existing parameter set can be transferred to a MICROMASTER 430 frequency inverter using STARTER or DriveMonitor (refer to Section 4.1 "Establishing communications MICROMASTER 430 ⇔ STARTER").

Typical applications for series commissioning include:

- If several drives are to be commissioned that have the same configuration and same functions. A quick / application commissioning (first commissioning) must be carried-out for the first drive. Its parameter values are then transferred to the other drives.
- 2. When replacing MICROMASTER 430 frequency inverters.

# 6.5 Parameter reset of factory setting

Operating Instructions (Compact)

#### Fault messages and Alarm messages 7.2

Fault	Significance
F0001	Overcurrent
F0002	Overvoltage
F0003	Undervoltage
F0004	Inverter Overtemperature
F0005	Inverter I <sup>2</sup> t
F0011	Motor Overtemperature I <sup>2</sup> t
F0012	Inverter temp. signal lost
F0015	Motor temperature signal lost
F0020	Mains Phase Missing
F0021	Earth fault
F0022	HW monitoring active
F0023	Output fault
F0030	Fan has failed
F0035	Auto restart after n
F0041	Motor Data Identification Failure
F0051	Parameter EEPROM Fault
F0052	Power stack Fault
F0053	IO EEPROM Fault
F0054	Wrong IO Board
F0060	Asic Timeout
F0070	CB setpoint fault
F0071	USS (BOP-2 link) setpoint fault
F0072	USS (COM link) setpoint fault
F0080	ADC lost input signal
F0085	External Fault
F0090	Encoder feedback loss
F0101	Stack Overflow
F0221	PID Feedback below min. value
F0222	PID Feedback above max. value
F0450	BIST Tests Failure (Service mode only)
F0452	Belt Failure Detected

Alarm	Significance	
40501	Current Limit	
40502	Overvoltage limit	
40503	Undervoltage Limit	
40504	Inverter Overtemperature	
40505	Inverter I <sup>2</sup> t	
A0511	Motor Overtemperature I <sup>2</sup> t	
40522	I2C read out timeout	
40523	Output fault	
A0541	Motor Data Identification Active	
40590	Encoder feedback loss warning	
40600	RTOS Overrun Warning	
40700	CB warning 1	
A0709	CB warning 10	
A0710	CB communication error	
40711	CB configuration error	
40910	Vdc-max controller de-activated	
40911	Vdc-max controller active	
40912	Vdc-min controller active	
A0920	ADC parameters not set properly	
A0921	DAC parameters not set properly	
A0922	No load applied to inverter	
A0952	Belt Failure Detected	

rice r. Belt Failure
