## APPLICATION OF LIGHTING CONTACTORS

Lighting contactors have evolved from the need for more than just simple on-off manual control of lights. Today's requirements call for the development of new and varied types of control. Often, the application will call for remote control of lighting from some distant location. This control may or may not be in addition to a master control station at a central location. Or certain applications include the use of automatic control by time clocks or photoelectric cells. Whatever the need may be, applications are increasing, and lighting contactors are designed to meet the ever-changing requirements.

Square D lighting contactors offer a time proven design for better electrical and mechanical performance. They are used wherever reliable, convenient and economical control of indoor and outdoor lighting is required. Typical installations include:

- parking lots
- industrial plants
- office buildings
- theaters and auditoriums
- hospitals and institutions
- shopping centers
- stadiums
- airports

## LIGHTING CONTACTORS FOR ENERGY MANAGEMENT

Lighting contactors should be an integral part of any Energy Management System. They help conserve energy consumption and reduce utility bills by providing three types of control.

Lighting contactors offer both **centralized** and **remote control** of lighting. Circuits can be turned on and off from a number of remote locations in addition to a master control station.

They also offer **selective switching** of lights. Selective switching is the control of one or more individual lighting circuits, independent of the other circuits. This design allows the potential for turning on only the amount of lighting that is actually needed.

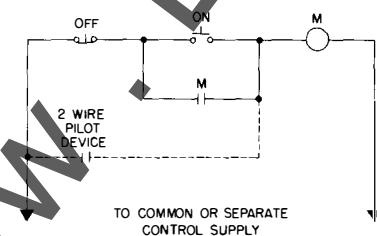

Lighting contactors can provide **automatic control** to insure that lights will be turned off when not needed. There are a number of devices that, when used with lighting contactors, offer a convenient and reliable method of automatically controlling lighting loads: program time clock, photoelectric cell, programmable controller and demand controller.

## ELECTRICALLY HELD VS. MECHANICALLY HELD

## ELECTRICALLY HELD

Electrically held lighting contactors require voltage to be continuously applied to the coil to maintain the contacts in the closed position (or open position in the case of normally closed contacts). Electrically held devices are used:

- wherever a high rate of operation is encountered (such as heating elements or electric furnaces).
- in areas where the ac hum of a continuously energized coil would not be annoying, such as factories, machine shops or outdoors.
- with three-wire control schemes to provide low voltage protection, thus preventing the load from being automatically energized after restoration of power following a failure.

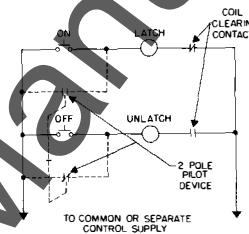

Electrically Held

## MECHANICALLY HELD

Mechanically held lighting contactors require only momentary application of voltage to be latched (turned on) or unlatched (turned off). Since the contacts are mechanically held closed (open if normally closed contacts), the latch and unlatch coils need only be momentarily energized, thus eliminating ac hum. This feature allows for quiet application of the mechanically held lighting contactor and makes it the perfect choice for quiet locations. As standard, Square D lighting contactors are provided with coil clearing contacts, assuring that the coils will be de-energized even if the control device is held closed. Mechanically held lighting contactors are used wherever:

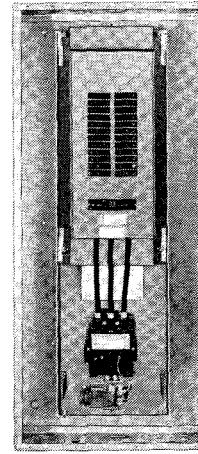

- quiet operation is required (offices, hospitals, schools).
- circuits are required to remain closed (or open in the case of normally closed contacts) during a power failure.
- excessive control line distances are required.

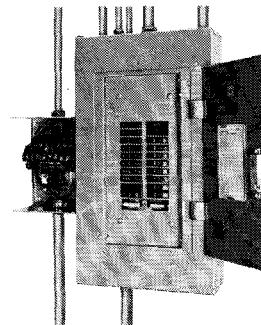

Mechanically Held

## INSTALLATION OF LIGHTING CONTACTORS

For new installations, lighting contactors can either be installed right in the lighting panelboard, or in their own enclosure next to or remote from the panelboard.

In existing applications where the lighting control system is being updated, lighting contactors can be installed in their own enclosure next to a lighting panelboard.

▲ Types L and LL contactors also have a ballast lamp rating of 15 amperes 347VAC when connected 1 Pole to Load and 600VAC when connected 2 Poles to Load on 1 $\phi$  and 3 Poles to Load on 3 $\phi$ .

\* For tungsten lamp or resistance loads only.

### TUNGSTEN LAMP LOADS

Tungsten lamps have a positive resistance characteristic (resistance to the flow of electric current increases as its operating temperature increases), thus exhibiting an increase in resistance when the lamp is energized. Therefore, these lamps have a high inrush current of up to 18 times normal current resulting from the low cold resistance of the tungsten. Examples of tungsten lamps include incandescent lamps, iodine lamps, quartz-iodine lamps and infrared lamps.

### BALLAST LIGHTING LOADS

A ballast lighting load consists of electric discharge (vapor) lamps. All types of vapor lamps possess a negative resistant characteristic. The resistance within the lamp decreases with an increase in current, and vice versa. Without some form of current limiting device in the electric circuit, the current would rise quickly until lamp failure occurred. This current limiting element is known as the ballast. A ballast is an impedance used to stabilize the current in a vapor lamp. It has the property of increasing in resistance as current through it increases and decreasing in resistance as current decreases. Thus it tends to maintain a constant current through it. Types of ballast lighting include high intensity discharge (HID) lamps — mercury vapor, metal halide and high pressure sodium — and fluorescent lamps.

### RESISTANCE LOADS

Square D lighting contactors are fully rated for resistance loads up to 600 volts, Table 1. They can be used on resistance-type boilers, electric furnaces, electric water heaters and snow melting cables and panels.

### MOTOR LOADS

This load consists of motors having an inrush current, or locked-rotor current, of approximately 6 times the full-load current. Square D Type S lighting contactors are fully rated for motor loads and have a horsepower rating equal to the equivalent NEMA Size motor contactor, Table 2.

### MIXED LOADS

All Type S lighting contactors are rated to handle mixed loads, consisting of a combination of lighting, resistance and motor loads. Table 3 was developed to make selection of lighting contactors for mixed loads easier. Simply follow these steps:

- Determine the total load by summing the lighting, resistance and motor (full load currents of each motor) loads.
- Calculate the lighting and resistance (total non-motor) load as a percentage of the total load.
- From that percent column in Table 3, determine the size lighting contactor required at the specified motor voltage.

# ELECTRICALLY HELD LIGHTING CONTACTORS

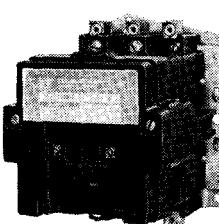

## FOR TUNGSTEN & BALLAST LIGHTING AND RESISTANCE HEATING LOADS

JANUARY, 1981

Electrically held lighting contactors are used in areas where the ac hum of a continuously energized coil would not be annoying (factories, outdoors, etc.) or wherever a high rate of operation is encountered. They are normally operated from a 2 wire, maintained contact input device.

**TYPE L**

- 2-12 Poles
- Convertible Contacts with N.O. and N.C. Indicators
- Silver Alloy Double Break Contacts
- Industrial Duty
- Adder Pole Kits Available
- DC Coils are Available (6 Poles Max.)

**TYPE S**

- Proven Type S Design
- No Arcing Contacts Required
- Enclosed Silver Alloy Double Break Contacts
- Lugs Suitable for Use with Copper or Aluminum Wire (60-800 Amperes Only)
- Combination Lighting Contactors Available (pages 6 and 7)

\* Price does not include holding circuit interlock.

○ Factory conversion of N.O. contacts to any combination of N.C., add \$12 to list price.

‡ NEMA Type 12 enclosures may be field modified for outdoor applications. For details, see Class 9991.

● Separate enclosures are available for these devices. Order open type contactor and separate Class 9991 enclosure from page 9.

▲ Form FT is provided as standard; include line voltage when ordering. Control voltage is 120V/60HZ. For separate control, add Form S to Type Number.

**FACTORY MODIFICATIONS FOR ELECTRICALLY HELD LIGHTING CONTACTORS**

(For additional modifications refer to Factory Modifications and Forms.)

Substitute Class R rejection type fuse clips for standard fuse clips on <b>combination lighting contactor</b>	1, 4, 12	Y107-1	N/A	6.	6.	12.	12.	28.	N/A

▲ Indicate pilot light color as Form P (Red) or Form P (Green), etc., and how pilot light is to be wired into the circuit. Insert "Push-To-Test" before color if applicable.

★ DO NOT use Form X for any interlock which is wired in series with pilot light, but DO specify how pilot light and interlock are to be wired into the circuit.

† Order device with additional poles — interlocks not available.

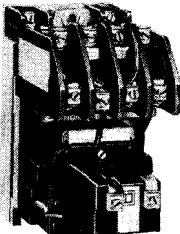

■ Not available on 12 pole device; use "On-Off" selector switch (Form C6).

JANUARY, 1981

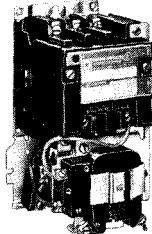

# MECHANICALLY HELD LIGHTING CONTACTORS FOR TUNGSTEN & BALLAST LIGHTING AND RESISTANCE HEATING LOADS

CLASS  
**8903**

Mechanically held lighting contactors are used wherever quiet operation is required (offices, hospitals, theatres, etc.) or where excessive control distances are encountered. As standard, Square D mechanically held lighting contactors are provided with coil clearing contacts, assuring that the coils will be de-energized even if the control device is held closed.

**TYPE LL**

- 2-10 Poles
- Convertible Contacts with N.O. and N.C. Indicators
- Silver Alloy Double Break Contacts
- Industrial Duty
- Adder Pole Kits Available
- Coil Clearing Contacts Standard

**TYPE S**

- Proven Type S Design
- No Arcing Contacts Required
- Enclosed Silver Alloy Double Break Contacts
- Lugs Suitable for Use with Copper or Aluminum Wire (60-800 Amperes Only)
- Combination Lighting Contactors Available (Page 6)
- Coil Clearing Contacts Standard

♦Form FT is standard; include line voltage when ordering. Control voltage is 120V/60 Hz. For separate control order "Form S."

†For NEMA Type 4X Watertight, Dusttight, and Corrosion-Resistant Glass-Polyester enclosure, consult field office.

Type SMA-62

It is often desirable to install the branch-circuit protective device and lighting contactor, combining switching and over-current protection, in one enclosure. Combination lighting contactors are particularly well suited for industrial, highway and area lighting applications, or where a lighting circuit may have to be disconnected for periodic maintenance. They may also be used for resistance heating loads.

Combination lighting contactors provide many advantages over a separate branch-circuit device and contactor. The single unit occupies less space, makes a neater installation, is quicker to install, and provides added protection for operating personnel.

- Disconnect Switch and Circuit Breaker Types
- Rugged Flange Operator
- Industrial Duty
- Room to Spare for Modifications

# NIGHT-MASTER™

## OUTDOOR LIGHTING CONTROLLER

CLASS  
8903

NIGHT-MASTER™ Outdoor Lighting Controllers offer disconnecting means, overcurrent protection and a lighting contactor in one NEMA Type 3R Rainproof enclosure. These combination units satisfy requirements of the National Electrical Code and UL 508 for service entrance equipment.

NIGHT-MASTER Outdoor Lighting Controllers offer an advantage over enclosed safety switches or circuit breakers. The electrically held lighting contactor provides the opportunity for automatic or remote control of all types of lighting. When used with photoelectric cells, time clocks or other control devices, they offer an economical means of controlling outdoor lighting. Typical installations include lighting of streets, parking lots and billboards, and recreational lighting such as tennis courts, stadiums, country clubs and parks.

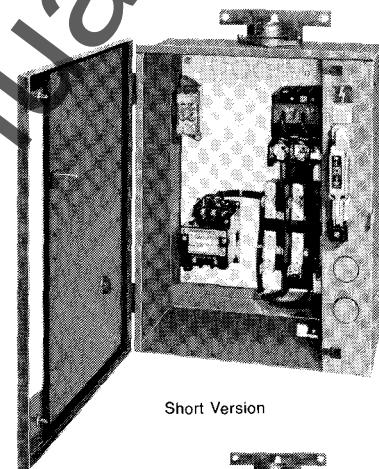

Many standard and special modifications, either factory or field addable, are available with the NIGHT-MASTER Outdoor Lighting Controller. All factory installed modifications shown below are UL listed. The short version is suitable for most applications. The long version is used for certain factory installed accessories, or for adding your own special modifications in the field. It has a lower panel that is removable for easy field addition of accessories.

# LIGHTING CONTACTORS

## APPLICATION DATA

JANUARY, 1981

### POWER POLE ADDER KITS

#### FOR TYPE L

The kits below are used to add 20 ampere power poles to existing Type L contactors when additional circuits are required. Type L lighting contactors are supplied with mounting brackets, so that adder poles may be mounted from the front by a single captive screw. Adder poles are supplied as standard with N.O. contacts which are convertible to N.C.

<b>Note:</b> One power pole kit, either single- or double-pole, must be added to both the left and right hand side of the contactor.		May be Added to Contactor Type	Power Pole Adder Kit	
			Class 8903	Type
Type L1L		LO-60	<b>Single Pole</b>	
Type LO-60		LO-80	L1L	\$24.
Type L1R		LLO-30	L1R	24.
		LLO-40		
		LLO-60		
Type L3L		LO-80	<b>Double Pole</b>	
Type LO-80		LO-1000*	L3L	48.
Type L3R		LLO-60	L3R	48.
		LLO-80*		

\*Single pole power pole must be removed before double pole power pole can be installed.

#### D1A DISCOUNT

#### ELECTRICAL INTERLOCKS

Additional electrical interlocks can be added to Type S lighting contactors. The interlocks mount on either side of the basic contactor. The contacts of the electrical interlocks can be changed from N.O. to N.C. or vice versa in the field.

Electrical Interlock Kit Description		Class 9999	
Type	Price	Type	Price
External Electrical Interlock with 1 N.O. contact, L.H. or R.H. mounting .....	SX-6	\$24.	
External Electrical Interlock with 1 N.C. contact, L.H. or R.H. mounting .....	SX-7	24.	
External Electrical Interlock with 1 N.O. and 1 N.C. isolated contacts, L.H. or R.H. mounting .....	SX-8	32.	
External Electrical Interlock with 1 N.O. overlapping contact, L.H. or R.H. mounting*	SX-9	24.	
External Electrical Interlock with 1 N.C. overlapping contact, L.H. or R.H. mounting*	SX-10	24.	

Class 9999 Type SX-8

\* Types SX-9 and SX-10 must be used together and are suitable for applications where it is necessary for a normally open interlock contact to overlap a normally closed interlock contact.

#### CONTROL CIRCUIT FUSE HOLDER

The control circuit fuse holder is designed to be used on Type S lighting contactors when either one or two control circuit fuses ( $1\frac{3}{32}'' \times 1\frac{1}{2}''$ ), 6 amperes maximum, are required.

The fuse holder is supplied mounted to the same bracket used on the external interlocks on the 30 and 60 ampere sizes and is mounted directly to the baseplate on the lighting contactor on the 100-800 ampere sizes.

Description		Class 9999	
Type	Price	Type	Price
Single Fuse Unit* .....		SF-3	\$16.
Two Fuse Unit* .....		SF-4	24.

\*Fuses not included.

#### D1B DISCOUNT

A single-pole or double-pole kit can be added to any 2 or 3 pole 30 or 60 ampere Type S lighting contactor to make a 4 or 5 pole device. Factory assembled 4 and 5 pole contactors utilize the basic 3 pole device with a single or double-pole kit installed. Only one power pole can be added per contactor. Sufficient room is provided in all enclosure styles for the addition of a power pole kit.

To add the power pole to a 60 ampere contactor, it is necessary to replace the coil. Select a 4-5 pole coil from the coil table in Class 9998.

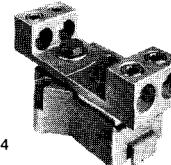

The 30 or 60 ampere power pole can be added to 100-800 ampere contactors by using the special adapter bracket.

Ampere Rating	Description	Class 9999 Type	Price
30	One N.O. One N.C. One N.O. and One N.C.	SB-6 SB-7 SB-8 SB-9 SB-10	\$ 44. 44. 88. 88. 88.

....	Adapter Bracket for mounting 30 or 60 ampere kit above on 100, 200, 300, 400, 600 or 800 ampere contactor.	SBT-1	6.

\*When power pole is added to 60 ampere contactor, a 4 pole coil is also required. Order from Coil Table in Class 9998. 60 ampere power poles are suitable for use with copper or aluminum wire.

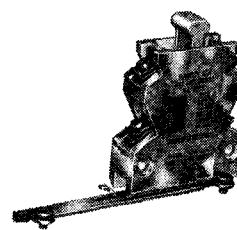

#### SOLID NEUTRAL

The Class 9999 Type SN kit can be used on Type S lighting contactors and other controllers where field addition of a solid neutral is required. Each kit has lugs suitable for both copper and aluminum wire, and mounts with two screws.

\* Replace reset assembly with proper closing plate. For NEMA 4 use Class 9001 Type K52, for NEMA 12 use Class 9001 Type K51 and for Flush Mounting (except Types LF-1 and SEF-11) use Class 9991 Type SG-2.

# NEMA Type 12 enclosures may be field modified for outdoor applications. For details refer to Class 9991.

♦ For Type S electrically held lighting contactors only. Consult field office for Type S mechanically held.

● Separate NEMA Type 1 surface mounted enclosure available. Specify Class 9991 Type LG-1, \$40.

### OVERSIZE ENCLOSURES

The enclosures listed below are for use with electrically and mechanically held open type Class 8903 Type L 20 ampere and Type S 30 and 60 ampere lighting contactors. These enclosures include a panel with space and drilling for an open type contactor and fused control circuit transformer (Form FT) and/or an auxiliary relay for

use with single pole pilot devices (Form R6). In addition, three closing plates are provided as standard for easy installation of Class 9001 Type K oiltight control units.

Select transformer from selection table. When auxiliary relay is required, use either a Class 8501 Type DO-22 or Type LO-11 relay.

# LIGHTING CONTACTORS

## APPLICATION DATA

JANUARY, 1981

### WIRING TERMINALS

In general, all Square D lighting contactors, 60-800 amperes, manufactured after February, 1978, are provided with lugs suitable for both copper and aluminum wire. Type L 20 ampere multi-pole and Type S 30 ampere devices have lugs suitable for copper wire only. All devices have control terminals suitable for copper wire only.

If lugs suitable for copper wire only are required on the 60-800 ampere devices, order lighting contactor with Form Y-157, no additional charge.

†Line and load electrically and mechanically held. Load side only on combination.

### COMPRESSION LUGS

Square D Versa-Crimp® compression lugs for Type S lighting contactors, 100-800 amperes, are available factory installed (Form Y157-4) or as a field modification kit (see table at right). They are suitable for both copper and aluminum wire.

One VCEL lug (one or two on the 400 & 600 ampere devices) is required for each line or load terminal. Each Class 9999 Type AL hardware kit includes mounting hardware for 3 terminals, line or load side.

EXAMPLE: To install compression lugs on a 300 ampere 3 pole device, line and load sides, order six (6) VCEL-060-12H1 lugs and two (2) Class 9999 Type AL-11 hardware kits.

## AC LIGHTING CONTACTORS

## •APPLICATION

A lighting contactor is an electric switch operated by the action of an electromagnet. The contacts on the switch are used to make and break the currents to tungsten, fluorescent and mercury arc lamps. With the use of these contactors, relatively large load currents can be safely and conveniently controlled by small pilot duty devices, such as push buttons and toggle switches.

Gas-filled tungsten lamps have inrush currents approximately 15 to 17 times their normal operating currents. Standard motor control contactors must be de-rated when used on tungsten lamp loads, in order to prevent possible welding of the contacts on the high initial current. However, Square D Class 8903 lighting contactors, being specifically designed for such loads are applied at their full ratings.

Although primarily intended for use on AC, lighting contactors for use on DC are also available on special order.

## RATINGS

**Amperes** — Class 8903 AC lighting contactors are built in five sizes, from 30 amperes through 300 amperes.

**Poles** — All sizes of contactors are available in 2, 3, or 4 pole construction.

**Volts** — These contactors are suitable for use with AC loads having a maximum rating of 277 volts from line to neutral, 480 volts line to line.

Magnet coils are available for all AC voltages from 24 volts through 600 volts. They will operate the contactors satisfactorily on line voltages fluctuating as much as 15% below and 10% above the nominal coil rating.

**Frequency** — Standard magnet coil frequencies are 60, 50, and 25 cycles. If coils for other frequencies or for use in abnormal ambient temperatures are required, the Factory should be contacted.

## •CONTROL

**Remote Control** — It is frequently convenient to control a number of lights at some distance from the load. Rather than run heavy power wiring from the source to a large manual switch within reach of the operator, and then to the load, lighting contactors are mounted near the load, thus eliminating long runs of power wiring. This not only effects economy of installation, but also reduces operating costs and improves performance because of reduced voltage drop in the wiring. Since only two or three small connecting wires are required, each pilot switch may be located for the greatest convenience and installation economy. A load may be controlled from several remote locations by using a number of push buttons or pilot switches with each contactor.

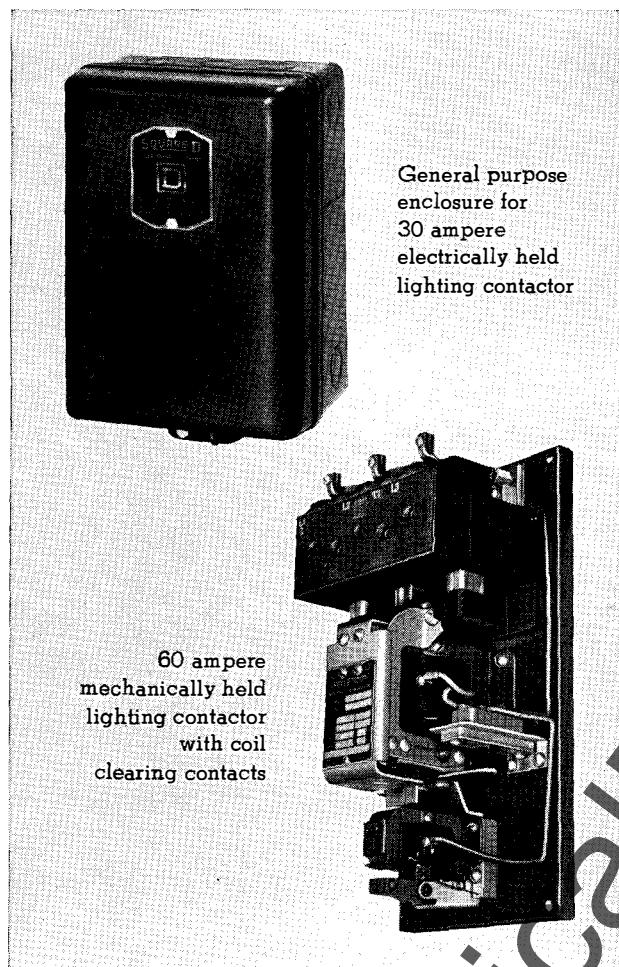

**Electrically held** contactors close when the magnet coil is energized and open when the magnet coil is de-energized. A maintained contact pilot switch is normally used to open and close the magnet coil circuit. When a contactor is to be operated from more than one pilot switch, momentary contact ON (normally open) and OFF (normally closed) push buttons must be used. This also necessitates the addition of a normally open electrical interlock to the contactor.

When maintained contact pilot switches are used, the contactor will open if the voltage fails, and immediately reclose when the voltage returns. With momentary contact pilot switches the contactor opens upon loss of voltage, but will not reclose after the voltage returns until the ON push button is operated.

**Mechanically Held** contactors close when the latch coil is energized, and remain closed until the unlatch coil is energized. Normally open momentary contact ON and OFF push buttons are used. Since each magnet coil is de-energized as soon as its push button is released, there is no distracting AC magnetic hum present. These contactors are, therefore, recommended for use in hospitals, schools, and other applications where noiseless operation is required.

## AC LIGHTING CONTACTORS

AUGUST, 1961

General purpose  
enclosure for  
30 ampere  
electrically held  
lighting contactor

60 ampere  
mechanically held  
lighting contactor  
with coil  
clearing contacts

**Coil clearing contacts** should be added to mechanically held contactors controlled by maintained contact pilot switches. These contacts de-energize the magnet coils after operation of the contactor has been completed. The desirable feature of complete absence of AC magnetic hum is thus retained.

### CONSTRUCTION

Class 8903 contactors in all sizes are the vertical action type, employing double break silver contacts which do not corrode and never need cleaning or dressing.

All contactors are provided with shading coils, embedded in the magnet frame, to reduce the AC hum to a minimum.

### FEATURES

**Accessibility**—One of the foremost features of Square D lighting contactors is accessibility for maintenance or repair.

All electrical equipment needs maintenance and replacement attention at regular intervals. That equipment which is easy to inspect and maintain receives more maintenance service and enjoys longer life. Thus, double economy is realized. All renewable parts of Square D lighting contactors can be inspected with a minimum of time and labor, using only a screwdriver and pliers.

Some of the outstanding features of Class 8903 contactors are:

1. Contacts replaceable without disturbing line and load wiring.
2. All parts front-mounted. It is unnecessary to remove the contactor from its enclosure for maintenance or replacement of any part.
3. Molded coils. Coils are less subject to mechanical injury. Coils operate cooler because of better heat transfer, thus last longer.

Class 8903 contactors are available with many special features, some of which are:

**Push button in cover**—Class 8903 contactors in all sizes are available with ON-OFF momentary contact push buttons mounted in the cover of the enclosure for external operation. (Electrically held contactors require the addition of a normally open electrical interlock). Where this arrangement is convenient from the operating standpoint, installation economies are obtained through the elimination of a separate push button station and its wiring. Separately mounted push buttons may also be connected in parallel with the one included with the contactor.

**Electrical Interlocks**—are available in arrangement and number to satisfy every practical need. They will be installed at the Factory if specified on the order, but can be easily installed in the field on all contactors. Interlocks for installation by users are listed in Catalog Section Class 9999. For 30 ampere lighting contactors, use the same interlocks as listed for Size 1 starters; for 60 ampere contactors, use Size 2 interlocks; for 100 ampere contactors, use Size 3 interlocks; for 200 ampere contactors, use Size 4 interlocks and for 300 ampere contactors use Size 5 interlocks.

### ENCLOSURES

**General Purpose Enclosures—NEMA 1**—are intended to prevent accidental contact with live parts and are suitable for general indoor use where normal atmospheric conditions prevail.

These surface mounting enclosures are constructed of heavy sheet steel, finished in gray enamel. All covers have latches with provisions for padlocking. ON-OFF momentary contact push buttons may be easily mounted in the covers of 30 through 200 ampere contactor enclosures, by removing either a cover knockout or cover plate.
