

Auxiliary, signalling and tripping relays RXMA1, RXMA 2 RXMS 1, RXSF 1, RXME 1, RXME 18, RXMH 2 & RXMT 1

1MRK 508 015-BEN Page 1 Issued June 2002 Changed since June 1999 Data subject to change without notice

Application (cont'd)

Types **RXME 1** and **RXME 18** are used where a low number of heavy duty contacts are required e.g. as trip relay. RXME 18 is a RXME 1 with an operating flag indicator. Type **RXMH 2** is used when many heavy duty contacts are required. It can be provided with an operating flag indicator, as an option.

Functions which can be obtained with additional components

Auxiliary relays can be used in a number of ways with different accessories to obtain a variety of types of operation. A few typical circuits are shown below.

Plug-in units with e.g., diodes, resistors and capacitors are shown in Catalogue 1MRK 513 004-BEN. Connection blocks type RTXE for attachment to the pocket of the rear side of the terminal bases can be ordered from the same catalogue.

Drop-out time-lag with a diode

To obtain a dropout delay of a dc relay or to protect an electronic circuit against transients, a diode unit across the relay coil (R) can be used. Diode unit, type RXTDA 1, or terminal base mounted type RTXE can be selected.

If the dropout time (t) in the table is too long it can be reduced with a resistor (r) connected in series with the diode

Туре	Typical dropout time, t, with diode ²⁾
RXMA 1	100-125 ms
RXMA 2	20 ms
RXMS 1 ¹⁾	10 ms
RXME 1 RXME 18	35 ms
RXMH 2	60 ms

 The diode is to be connected to terminals 21-28.

²⁾ The deviation in dropout time from the values in the table can be considerable, due to numbers of contacts, inductance in the coil, depending on operating voltage etc.

Drop-out delay can be achieved by connecting a parallel diode across the relay coil as shown. Please observe the polarities of the dc voltage and the diode.

When S makes the relay picks up instantaneously. When S breaks the relay drops our with a time lag caused by the diode.

Inductive transient protection

The diode also provides transient protection of the relay and also for the parallel connected devices by reducing the induced overvoltages (many kV's) caused by the inductance of the auxiliary relay upon disconnection from the dc supply when the energizing contact opens.

Transient protection (and shorter drop-out delays) may also be achieved by using a parallel connected resistor, thermistor or varistor across the relay instead of the diode. These components are available for mounting directly in the rear pocket of the terminal base using type RTXE component blocks.

Pick-up time-lag using a thermistor

When S makes, the current heats the thermistor t and its resistance drops as its temperature increases. When the current through R reaches the pick-up value, the relay picks up and the thermistor is short-circuited by a make contact on the relay.

Pick-up and drop-out time-lag using a capacitor

When S makes, the pick-up time is determinated by the values r, R and C. The relay picks up when C is sufficiently charged and the time lag upon drop-out is caused by C discharging through R after S breaks.

Pick-up time-lag using a capacitor (normal drop-out)

The pick-up time is determined by the values of r1, R and C. When the relay has picked up C is discharged across r2 and normal drop-out is obtained.

Impulse storing circuit (impulse lengthening)

When the impulse contact S momentarily makes, the relay picks up and remains picked up for a period the length of which is determined by r, R and C.

Impulse shortening circuit

When S makes, the relay R picks up instantaneously and remain a picked up until C is sufficiently charged. The relay then drops out, since the current through r and R falls below the relay drop-out valve. (S remains closed all the time).

RTXV Control unit

High-speed auxiliary relays can at earth-fault in unearthed DC voltage systems give unwanted operation.

To avoid the risk that the voltage caused by the earth-fault causes unwanted operation on auxiliary relays, we have designed a control unit, type designated RTXV, to be connected in series with the terminal of the relay coil.

The control unit connects applied voltage to the relay only if the voltage is large than 60-80% of the rated voltage of the unit. The voltage drop in the control unit is about 2 V.

The control unit is mounted in a component box, which in its turn can be mounted on the rear of the terminal base of COMBIFLEXrelays.

See Buyer's Guide 1MRK 513 007-BEN

Shorter pick-up times with separate seriesconnected resistor

The operating time can be reduced for auxiliary relays by connecting a separate resistor -r in the diagram - in series with the relay coil R.

The connection reduces the L/R ratio, i.e. the time constant for the drawn relay coil operating current.

The pick-up time and characteristics of the series resistor for a number of types of relays are listed in the table 1. The dispersion of the pick-up time is about $\pm 20\%$ at rated voltages and up to $\pm 50\%$ if considering voltage range variations.

The drop-out time of the relay will be approximately the same as for a relay without the series resistor.

Design

The auxiliary relays in the COMBIFLEX system permit interchanging between various types of relays chiefly because the coil terminals are always connected to the same terminal on the plug-in base of the relay. Relays having the same contact symbol can be interchanged without alteration of the connection.

The contact elements are made of silver, however, gold elements on the contacts can sometimes be necessary, for example in sulfuric atmospheres or when the voltage in the contact circuit is lower than 10 V and the current lower than 10 mA.

Each relay has a dust-tight cover, except the RXMS variants A and E, and is intended to be mounted on a terminal base. Terminal bases are available in four sizes. The relays are fixed to the terminal bases with two or four Phillips No. 2 cross-head screws. Each relay cover has a hole covered by a removable plastic plug with the exception of RXME 18, RXSF 1 and RXMT 1. Through the hole the armature of the relay can be activated. Relays with indicating flags have a resetting knob accessed from the outside of the cover.

The relays are marked with the type designation, Ordering No., rated voltage, and where applicable, the symbol of the relay is also shown.

All dc supplied relays, with the exception of RXMS 1 and RXMT 1, can be supplied with full-wave or half-wave rectified ac.

For supply with full-wave rectified ac, select relays with a rated voltage equivalent to the supply voltage.

For supply with half-wave rectified ac, a diode in addition to the series diode is to be connected in parallel across the coil and the rated voltage of the relay is to be equivalent to half the supply voltage. If transients are expected in the supply voltage, these determine the choice of matching diodes.

Smoothing capacitors are unnecessary in both cases.

The auxiliary relays will operate within a range of 80-110% of the rated voltage.

If the rated voltage is given as a voltage range, e.g. 110-125 V, the relays will operate within a range of 80-110% of each rated voltage between 110 and 125 V. Permissible temperature range is given in the data table.

Relays with twin contacts

Auxiliary relays used in automatic equipment for control and regulation must have a very high degree of contact reliability even at lower voltages. Auxiliary relays with twin contacts fulfil this requirement. A twin contact has two contact elements on each contact member and each of these makes independent and simultaneous contact with the corresponding element on the other contact member. This gives two parallel current paths and greatly reduces the risk of contact failures. The contact sets have contact levellers of wear-resistant material with a low coefficient of expansion. This means that the correct contact force is always obtained even in contact units containing numerous contact springs. Type RXMA, RXMS and RXSF contain twin contacts.

Fig. 1 Twin contact

RXMA 1

This relay is designed for dc supply. The outstanding features of this relay are its low power consumption and long mechanical life.

RXMA 2

This relay is a variant of RXMA 1, with a larger terminal plug-in plate, and a greater number of contacts.

The relay occupies two seats.

RXMA 1 and RXMA 2 have two or three sets of contact stacks. The system voltage across one stack of contacts must not exceed 300 V dc or 250 V ac. The corresponding voltage between contact stacks must not exceed 600 V dc or 500 V ac.

RXSF 1

The unit contains one or two smaller relays with three contacts and red indicating flags. The flags are reset manually with an external knob or automatically when the dc is switched off.

The RXSF 1 is also available as loss-of-voltage relay. The indicating flag is always automatically reset in this variant.

There are DC voltage and DC current operated versions of the RXSF 1 relay. See the selection tables on p. 10. The current operated relay may e.g. be used to indicate that breaker trip coil current has flown, i.e. as a series trip current flag (target).

Yellow indicating flags are available on request.

SCADA Interposing Relay type RXSF 1

Interposing relays for SCADA equipment must not misoperate due to induced AC overvoltages that may occur as a result of a relatively long distance between the RTU and the remote control panel. Such a misoperation may lead to maloperation of breaker or isolator open / close commands.

There is a variant of the well proven relay RXSF 1 that may be used to reduce the risk of such a misoperation. The RXSF 1 is designed to reject induced AC voltages. The SCADA interposing version of RXSF 1 is in addition designed to provide a higher operating current in order to even further increase security against maloperation due to induced AC voltage interference.

RXMS 1

This relay is designed for dc supply. It has a very short pick-up time, down to 4 ms for a make contact (variant A, 7 W). Variant B is a low power variant (3 W) with 1,5 ms longer pick-up time.

Variant E (7 W) is safe for capacitive discharge through the coil at dc earth faults. It has also a larger contact gap, which can withstand 2 kV test voltage.

Because of the high power consumption in variants A and E these variants should not be continuously energized.

The relay has an additional terminal (28) brought out between the coil and the series resistor. This terminal is intended for dropout delay by connecting a diode across the coil.

RXMS 1

(SE 940741)

Relays with bridge contacts

Auxiliary relays which are to be used as tripping relays or as operating relays should have a high breaking capacity, good contact reliability and be free from risk of contact welding. These qualities are possessed by relays with bridge contacts.

The contacts have two fixed contact members and a moving bridge-shaped member. This design with two breaking points in series gives high breaking capacity.

The moving contact member is designed so that a considerable sliding motion is obtained between the contact elements during closing; this increases contact reliability and reduces the risk of welding.

Types RXME 1, RXME 18 and RXMH 2 contain bridge contacts.

Fig. 3 Bridge contact

96000041)

Design (cont'd)

RXME 1

This relay is designed for dc supply. It has two or four contacts.

RXME 1

RXME 18

The relay consists of an RXME 1 relay fitted with a red indicating flag. The flag becomes visible when the armature picks-up and remains visible after drop-out. The flag is manually reset by means of a resetting knob in the cover. The relay has two contacts.

(SE900615)

RXME 18

RXMH 2

This relay has eight heavy duty contacts and can be fitted with an indicating flag which becomes visible when the armature picks-up and remains visible after drop-out. The flag is manually reset by means of a resetting knob in the cover. For checking the operation the relay has a push-button which is accessible through a hole in the cover. The relay occupies two seats.

Relays with single contacts

(dry-reed relays)

In certain cases auxiliary relays are used in a highly corrosive atmosphere or under other conditions where special contacts are required, e.g. for low voltages and currents such as in automatic control circuits with static components. For such applications, auxiliary relays with built-in special contacts, e.g. dry-reed elements should be used. A dry-reed element has one fixed and one moving contact of magnetic material. If the coil, which encircles a dry-reed element with a make contact, is energized, magnetic flux flows through the contact which then closes. When the coil is de-energized the contact opens.

In dry-reed relays with break contacts the coil also encircles a permanent magnet of which the flux holds the contact closed. When the coil is energized the flux of the permanent magnet is counter-balanced and the contact opens. When the coil is de-energized the contact is reclosed by the permanent magnet. This implies that dry-reed relays with break contacts are dependent on polarity, and the coil must be connected in accordance with the symbols in the ordering table.

Fig. 4 Single contact

RXMT 1

RXMT 1 has 2 dc-supplied dry-reed relays, each with one make or break contact (dryreed element). The relay is very fast and has a pick-up time of < 1.5 ms.

RXMT 1 should not be positioned alongside relays which have powerful magnets as they may cause RXMT 1 to remain in the pickedup position.

RXMT 1 (SE900621)

Tripping assemblies

Single auxiliary or flag relays of any model may be used in tripping circuits, depending on requirements. Specially designed combinations of relays mounted on terminal bases and apparatus bars are available. These tripping units combine an ultra-high speed relay, type RXMS 1 and a heavy duty relay for carrying and breaking high currents. Combinations with latching relays or time relays for prolonged trip pulse and delayed resetting are available.

Trip and indication module

An auxiliary trip module for tripping from transformer protection device, e.g. Buchholz, temperature, etc., is available. It contains up to 10 inputs and the inputs are safe for capacitive discharge. A timer provides the required pulse length.

Trip assembly
